INTRODUCTION

TIMSS 2007 Summary Report contains the most important national and international results of the survey.¹ It also provides the assessment frameworks which serve as the theoretical basis of the assessment. Trends data on students' achievement of the participating countries as well as background factors influencing students' achievement are also included in the report. It attempts to identify and compare national mathematics and science instructional practices, contexts and conditions. The report includes the TIMSS 2007 International Benchmarks of Mathematics and Science achievement representing the range of performance shown by the participating students. In addition, the report contains some test sample items released for public use and provides some data on them.

About TIMSS

TIMSS (Trends in International Mathematics and Science Study) is a series of international assessments measuring trends in mathematics and science achievement at the end of the fourth and eighth grades in a number of countries from all over the world. The goal is to provide comparative data about educational achievements across countries to improve teaching and learning of mathematics and science. In addition to providing data on trends, TIMSS also monitors curriculum coverage and implementation and search for the most successful and effective instructional practices of the actual time.

TIMSS is a project of the IEA. The IEA (International Association for the Evaluation of Educational Achievement) is an independent international organization of national research institutions and government agencies that has been conducting research studies of cross-national achievement since 1959. TIMSS & PIRLS Study Center at Boston College is responsible for the technical implementation and the international coordination of the assessment.

In the 2007 assessment cycle around 425,000 students from 59 countries participated in the assessment. There were four assessment cycles before (in 1995, 1999, 2003, and 2007)² and the fifth cycle, in 2011 is underway.

Which Countries Participated in TIMSS 2007?

Implementing TIMSS 2007 involved widespread participation from countries around the world. Exhibit I shows the map of the world identifying the 59 countries and 7 benchmarking participants (regional entities)³ participating in TIMSS 2007 in dark blue colour. The countries are listed in alphabetical order on the right hand side of the map.

For the fourth grade, this report contains TIMSS 2007 data for 37 countries⁴ and 7 benchmarking participants, including 13 countries that participated for the first time. In all, 183,150 students participated in the fourth grade assessment. For the eighth grade, the report contains data for 50 countries and 7 benchmarking participants, including 10 countries participating for the first time. In all, 241,613 students participated in the eighth grade assessment.

TIMSS considered the difficulty of comparability since students' age in eighth and fourth grades can vary in the participating countries due to different tradition and education system. For the sake of comparability these characteristics needed to be regulated. For the most part, TIMSS participants are students in the fourth and eighth years of schooling. However, to avoid testing very young children, the TIMSS guidelines specify that the average age should not be below 9.5 years old for the fourth grade or 13.5 years old for the eighth grade. Thus, countries where students start school at a very young age

¹ TIMSS International Reports: Mullis, I.V.S. et al.:TIMSS International Mathematics Report. TIMSS&PIRLS International Study Center, Lynch School of Education, Boston College, 2008. Martin, M.O. et al.: TIMSS 2007 International Science Report. TIMSS & PIRLS International Study Center, Lynch School of Education, Boston College, 2008.

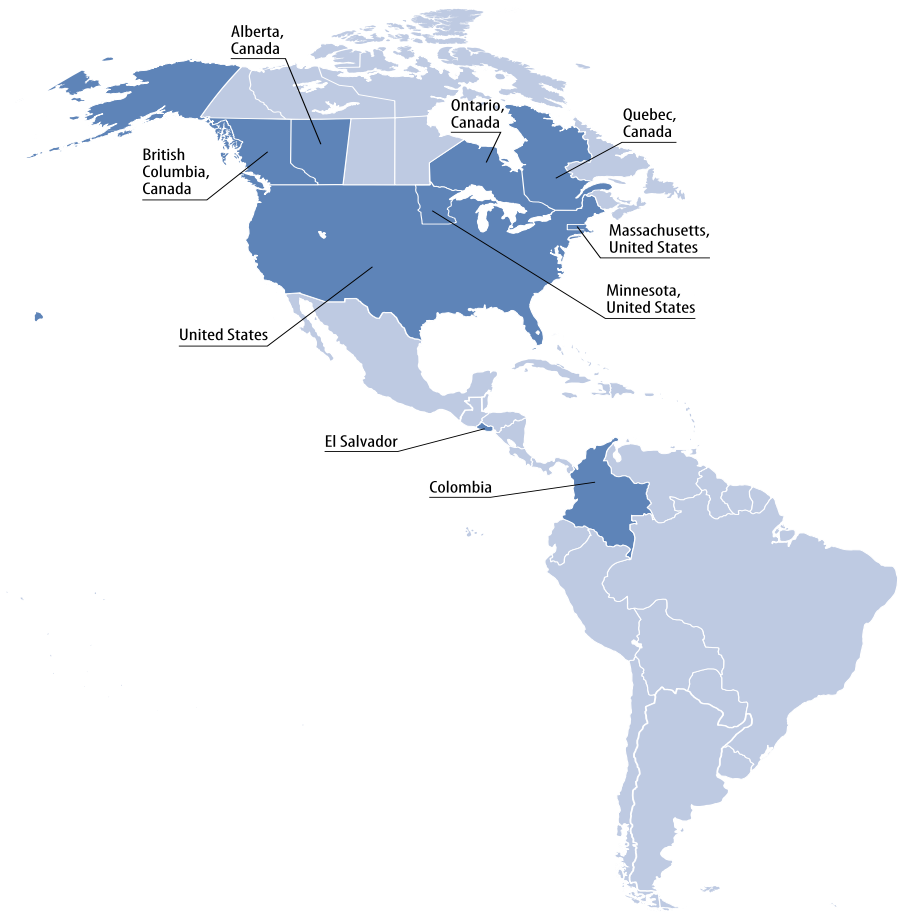

² In 1999 only eighth grade students participated in the assessment.

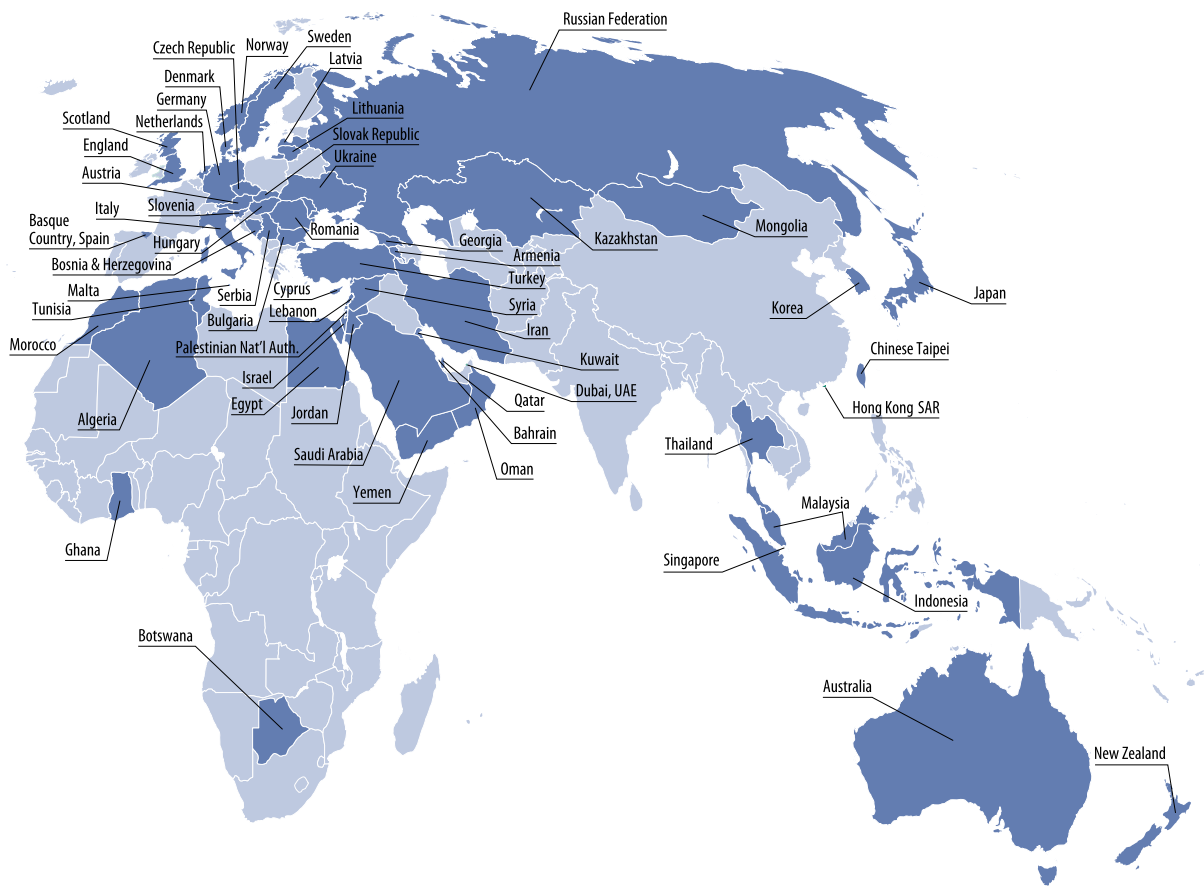

³ Benchmarking participants are member states, provinces, autonomous entities having partly or fully their own education system. Their achievements have been presented separately for their own request.

⁴ Results of Mongolia are not listed in the exhibits because of their missing data.

must assess students at the next higher grade. It should be noted that 5 countries (England, Scotland, New Zealand, Malta and Bosnia and Herzegovina) tested students in their fifth and/or ninth year of schooling in accordance with the guidelines.⁵

In each participating country and benchmarking entity the test should be conducted at the end of the school year.

Assessment Design

To create the TIMSS 2007 Assessment Design many aspects needed to be taken into consideration.

Test booklets had to include sufficient number of items in order to provide meaningful data about the students' achievement in the participating countries in mathematics and science as well as their achievement in the content and the cognitive domains.

To measure trends in 2007 test booklets had to contain items that were administered in previous assessment cycles.

To judge students' ability in mathematics and science there had to be sufficient number of questions and items in one test booklet.

It was also considered that impossible student burden should be avoided; however, testing time available had to be in proportion with the number of items to be tested.

The number of sampled students had to be ideal for calculating the students' average achievement in the participating countries.

To fulfil the above mentioned criteria there were 14 type of test booklets administered in each grade. Each student booklet consisted of four blocks of items, two blocks of mathematics items and two of science items. Each block of items appeared in two booklets. The 14 student booklets comprised 350 items at fourth grade, 430 items at eighth grade. There were 10-17 items in each block. Two of the blocks in each booklet contained trend items from 2003 and two comprised new items developed for TIMSS 2007. In order to have even more comparable data from the TIMSS 2003 and the TIMSS 2007 assessments, there were four student booklets per grade administered in 2007 which were previously used in the TIMSS 2003 assessment. Assessment time available for each student booklet at eighth grade was 2 x 45 (90) minutes, for fourth grades 2 x 36 (72) minutes. In Hungary there were 5,221 students at fourth grade, and 5,315 students at eighth grade completing the TIMSS 2007 student booklets.

Students, mathematics and science teachers and principals of the participating schools completed background questionnaires. The questions were designed to provide information about family background, school life and available school resources, students' attitudes and learning experiences, teachers' professional background and their practices as well as school climate.

⁵ Years of formal schooling and average age at the time of testing are displayed in the fourth and fifth columns in Exhibits 1 and 2.

MATHEMATICS

OVERVIEW

The TIMSS 2007 Assessment Frameworks⁶ contain the mathematics frameworks underlying the assessments at the fourth and the eighth grades. When compiling the students booklets and selecting items, test designers intended to cover the content domains of the subject. They also needed to take into consideration that students performed in the cognitive domains as well when completing the tests so they had to include items with different types of cognitive domains and difficulty in appropriate proportion suited to the students' ages. At both grades, the mathematics assessment framework for TIMSS 2007 was organized around two dimensions, a content dimension specifying the domains or subject matter to be assessed within mathematics, and a cognitive dimension specifying the domains of thinking process. The content domains differ for the two grades, reflecting the differences in the content of the mathematics taught at each grade. The definition of the cognitive domains are the same for both grades.

Mathematics Content Domains

Mathematics items in TIMSS 2007 assessment at fourth grade covered several topic areas which can be defined in the following content domains (for more details on content domains See Appendix):

- NUMBER** ~ Whole numbers. Fractions and decimals. Number sentences. Patterns and relationships.
- GEOMETRIC SHAPES AND MEASURES** ~ Lines and angles. Two- and three-dimensional shapes. Location and movement.
- DATA DISPLAY** ~ Reading and interpreting. Organizing and representing.

TIMSS 2007 mathematics assessment comprised 179 items at fourth grade (half of them were multiple choice items). The distribution of mathematics items by content domain at fourth grade is shown in Table I.

Table I Distribution of Test Items by Content Domains, Fourth Grade

Content Domain	Number of Items	Score to be Achieved
Number	93	98 (51%)
Geometric Shapes and Measures	60	65 (34%)
Data Display	26	29 (15%)
Total	179	192 (100%)

Mathematics items in TIMSS 2007 assessment at eighth grade covered several topic areas which can be defined in the following content domains.

- NUMBER** ~ Whole numbers. Fractions and decimals. Integers. Ratio, proportion, and percent.
- ALGEBRA** ~ Patterns. Algebraic expressions. Equations./Formulas and functions.
- GEOMETRY** ~ Geometric shapes. Geometric measurement. Location and movement.
- DATA AND CHANCE** ~ Data organization and representation. Data interpretation. Chance.

TIMSS 2007 mathematics assessment comprised 215 items at eighth grade (half of them were multiple choice items). The distribution of mathematics items by content domain at eighth grade is shown in Table II.

⁶ Mullis, I.V.S.et al.:TIMMS 2007 Assessment Frameworks. TIMMS & PIRLS International Study Center, Lynch School of Education, Boston College, 2005.

Table II Distribution of Test Items by Content Domains, Eighth Grade

Content Domain	Number of Items	Score to be Achieved
Number	63	72 (30%)
Algebra	64	69 (29%)
Geometry	47	50 (21%)
Data and Chance	41	47 (20%)
Total	215	238 (100%)

Mathematics Cognitive Domains

The covered cognitive skills in TIMSS 2007 Mathematics Assessment were the same at both grades.

KNOWING ~ Recall. Recognize. Compute. Retrieve. Measure. Classify/Order.

APPLYING ~ Select. Represent. Model. Implement. Solve routine problems.

REASONING ~ Analyze. Generalize. Synthesize/integrate. Justify. Solve non-routine problems.

The distribution of mathematics items by cognitive domain at both fourth and eighth grades is shown in Table III.

III. táblázat A tesztkérdések megoszlása a kognitív területek között, 4. és 8. évfolyam

Grade	Cognitive Domains	Number of Items	Score to be Achieved
4.	Knowing	69	73 (38%)
	Applying	70	75 (39%)
	Reasoning	40	44 (23%)
	Total	179	192 (100%)
8.	Knowing	81	83 (35%)
	Applying	88	98 (41%)
	Reasoning	46	57 (24%)
	Total	215	238 (100%)

In order to have comparable data in trends, some of the items used in TIMSS 2007 are kept secure for use in measuring trends over time in subsequent assessments. On the other hand, there are items released into the public domain for those who are interested in the characteristics of items and the assessment in general. These items and those which were used in previous assessments and were released for public use can be found at the TIMSS website timss.bc.edu in Hungarian www.timss.hu.

RESULTS AND TRENDS

Results of TIMSS 2007 can be compared in many ways. In this chapter the average student achievements in mathematics compared to the achievement of the previous cycles in the participating countries will be displayed. In addition, average student achievement by content and cognitive domains in participating countries and their relations are presented. Results of average achievements by gender and the percentage of students reaching TIMSS 2007 benchmarks are also described.

Results and differences

Exhibits 1 and 2⁷ show the average mathematics scale scores for the participants in TIMSS 2007. For each grade, countries are shown in descending order of average scale score. There is a symbol by a participant's average scale score indicating if the average achievement is significantly higher (up arrow) or lower (down arrow) than the scale average of 500 TIMSS average scale score which was established based on the 1995 assessment.

Although the achievements are displayed on a scale with a mean of 500 and a standard deviation of 100 for both grade, it should be noted that the results for the fourth and eighth grades are not directly comparable.

In addition, Exhibits 1 and 2 show the average scale score with its confidence interval and the 5th, 25th, 75th, and 95th percentiles. 50 percent of students can be found between the 25th and the 75th percentiles in each country, and the middle 90 percent of students are between the 5th and 95th percentiles. From the difference between the results of the 95th and 5th percentiles the heterogeneity of the participating countries' results can be concluded. Higher difference rate means a more heterogeneous quality of the education system, while lower difference rate indicates more homogeneous quality of education in the country.

It can be concluded that Asian countries top at both the fourth and the eighth grades. The average achievements of Hungarian students are above the international average at both grades.

At the fourth grade, Hong Kong SAR and Singapore were the top performing countries, their average achievements were 100 points higher (one standard deviation above the mean) than the TIMSS average scale score of 500. At fourth grades, there were 13 countries outperforming the Hungarian students significantly (among them are Hong Kong SAR, Singapore, Chinese Taipei, Japan, Russia, England, Latvia, Netherlands, United States, Germany). There are five countries whose results show no statistically significant difference with the average performance of Hungarian students (Australia, Italy, Austria, Sweden, Armenia), and there are 17 countries where the average achievements are significantly lower than that of Hungarian students (among them are Slovakia, Czech Republic and Norway).

At eighth grade, Chinese Taipei, Korea and Singapore have outstandingly high results. Their average achievements were nearly 100 points higher than the TIMSS 500 scale average (598, 597, and 593). Also, Hong Kong SAR, improved with 32 points compared to the previous cycle, and Japan are among the top countries (572 and 570 respectively). At eighth grade, students from only these Far East countries outperformed Hungary significantly. Hungarian students' average achievements are similar to the performance of students from England, Russia and United States. On the other hand, Hungarian students achieved significantly higher scores than students from the other participating countries including Lithuania, Czech Republic, Slovenia, Australia and Sweden.

21., 22. pages

The TIMSS mathematics scales for the fourth and eighth grades were established based on the performance of students in the 1995 assessments with an international mean of 500 and a standard deviation of 100. Since the range of the participating countries and the average achievements of the countries can be varied from one assessment cycle to another, instead of changing the scale each time the 1995 assessment scale was used in the 1999, the 2003 and the 2007 assessments. Therefore, the TIMSS 500 average scale score, which is noted several times in our report, is not equal with the international average achievement scale score of the participating countries in the 2007 assessment cycle.

How Has Mathematics Achievement Changed Since 1995, 1999 and 2003?

Exhibit 3 displays changes in average mathematics achievement for the countries and benchmarking participants that have comparable data from previous TIMSS assessment at fourth grades. Exhibit 3 shows the differences in the scores of the consecutive cycles. Where the difference is significant, it is marked with an up or down arrow.

At the fourth grade, 23 countries have data from either 1995 or 2003 or both cycles that can be compared to 2007.

23–24. pages

⁷ See Exhibits and Tables at the end of this chapter.

25–26. pages

Between 1995 and 2007 eight participating countries show significant improvement in their average student scale scores, the most considerable improvement can be found in England (57 points), Hong Kong SAR (50 points), and Slovenia (40 points). The average student achievements in these countries continuously improved in the assessment cycles; there was a significant improvement between 1995 and 2003 as well as between 2003 and 2007.

There are four participating countries which show significant decline in their average achievements in mathematics between 1995 and 2007, among them the Czech Republic (54 points) and Austria (25 points) declined the most significantly.

Among countries which joined the TIMSS assessment in 2003, Armenia and Chinese Taipei showed the most significant improvement. Armenia reached the TIMSS 500 scale average by 2007 with a 44-point improvement which is almost half of the standard deviation. On the other hand, Tunisia had much weaker results in 2007 compared to its achievement in 2003, its achievement declined with 12 score points.

Countries that participated in all of the three assessment cycles mostly showed consistency in their achievement, there was no significant change in the average results. Norway is an exception which showed a considerable decline in 2003 but recovered in 2007 showing no essential change from 1995.

It can be noted that Hungary had a significant decline by 2007 compared to both the results of 2003 and 1995. The 7-score-point increase between 1995 and 2003 did not result in significant improvement. On the other hand, the average achievement in 2007 shows a significant decrease compared to the results of both the 1995 (12 points decrease) and the 2003 (19 points decrease) average scale scores.

At the eighth grade, there are 36 countries with at least two assessment results, Exhibit 4 shows their average scale scores and the differences from 1995, 1999, 2003 to 2007. There were five countries showing significant increase in their average student achievement in mathematics between 1995 and 2007. Colombia, with 47 points, had the highest improvement in trends in 2007; in addition Lithuania (34 points), Korea (17 points) and England (16 points) showed the most significant gains. There were ten countries showing significant decline in their average scale scores between 1995 and 2007, Hungary was one of them. Bulgaria had the most significant decline (63 points), followed by Sweden (48 points) and the Czech Republic (42 points). Similar to the fourth grades, countries which participated in more assessment cycles show consistency in their achievement, most countries have one or two increases/decreases in their achievement during the four assessment cycles and one or two non-significant changes. On the other hand, Norway, Cyprus and the top performing Hong Kong SAR also show fluctuation in their achievement.

Hungarian students showed slight fluctuation in their performance between 1995 and 2003, however, they showed significant decline by 2007 compared to each cycle (12 points compared to 2003, 15 to 1999, 10 points to 1995). Nevertheless, only the top four performing Far East countries were before them.

Trends Across Grades: Fourth to Eighth Grade Cohort Analysis

Because TIMSS is conducted on a four-year cycle, the cohort of students that was assessed in the fourth grade in 2003 had reached the eighth grade by 2007, and thus this cohort was assessed twice in TIMSS. This enables the 17 countries that assessed both grades in both assessments to examine how their performance order relative to each other changed as the fourth grade students of 2003 became the eighth grade students of 2007. The results are presented in Table 1. The four small tables of Table 1 show the average mathematics achievements of the 17 countries in descending order for both grades in 2003 and 2007. Triangles pointing upward indicate that the country average is significantly higher than TIMSS scale average of 500; triangles pointing downward indicate that the country average is significantly lower than TIMSS scale average.

Most countries do not show remarkable changes in their rankings in the 4 tables. Besides there are countries which performed better in both cycles at one particular grade. Lithuania, for example had better results at fourth grades in both assessment cycles. The reasons for such differences

27. page

between the grades can be concluded from differences in education systems and curricula. Some countries show declines at both grades, including Hungary; others show improvement between 2003 and 2007 at both grades.

Achievements in Content and Cognitive Domains

Tables 2 and 3 present average achievement in each of the content and cognitive domains for fourth and eighth grades. Results are presented in each domain on the TIMSS scale average of 500 with a standard deviation of 100. Countries are displayed in alphabetical order. The achievements in the scales cannot be directly compared because of the different characteristics of items. However, the relative rankings of participating countries, as well as the average scores compared to the TIMSS scale average can be analysed. It is also possible to describe each country's relative strengths and relative weaknesses in each content and cognitive domain and also that the results in which domain can be considered as relatively good or weak compared to the other countries.

Comparing average achievements in the mathematics content domains, it can be concluded that Hungarian students have significantly higher scale scores than the TIMSS scale average with around 10 points in each content domain except for Data Display, where the 4-point difference is within the statistical error.

At the eighth grade, Hungarian students have significantly higher scale scores than the TIMSS scale average in each content domain, except for Algebra, where Hungarian students have 3 points higher scores than the TIMSS scale average. The differences range from 8 to 24, and it is the Data and Chance domain where the difference is the highest.

Hungarian students have significantly better results compared to the TIMSS scale average in all three cognitive domains in both fourth and eighth grades. In fourth grade, the differences are 11, 7, and 9 points, in eighth grade the differences are 18, 13, and 13 points.

In both grades, the countries scoring highest on the overall mathematics assessment tended also to be the highest-scoring countries in each of the content and cognitive domains and the countries scoring lowest overall tended to be those with lowest scores in the subdomains.

In the fourth grade, Hong Kong SAR was a top performer in all three content areas, with Singapore with the highest achievement in Numbers and Data Display as well; with Japan joining these countries in Data Display. Hong Kong SAR also had the highest average achievement in each of the cognitive domains, Singapore alone had similar results in the cognitive domains.

In the eighth grade, Singapore had the highest average achievement in the content area of Numbers, closely followed by Korea and Taiwan. In algebra, Taiwan had the highest achievement followed closely by Korea. In Geometry, Taiwan and Korea had the highest average achievement, while in the Data and Chance category Korea and Singapore. At the eighth grade, Taiwan was the top-performer across the cognitive domains.

28., 29. pages

Gender Differences in Mathematics Achievement

At the fourth grade, there was no difference in international average achievement between boys and girls. The situation varies from country to country whether boys' average achievement is higher or that of girls'. Most of the participating countries, including Hungary, however, do not show significant difference in average achievement in mathematics between girls and boys. It can be concluded the same looking at the results in the content domains and cognitive domains achieved by Hungarian boys and Hungarian girls.

At the eighth grade, the average achievements of girls in mathematics are significantly better than those of boys internationally. In Hungary, however, there is no significant difference between the performance of boys and girls overall; considering content and cognitive domains, it can be concluded that boys have better results in number, while girls perform better in the algebra content domain.

MATHEMATICS ACHIEVEMENT SCALE, INTERNATIONAL BENCHMARKS AND PERCENTAGE OF STUDENTS REACHING THE INTERNATIONAL BENCHMARKS

In order to interpret the students ability in a meaningful way, TIMSS uses four points on the achievement scale as international benchmarks. The Students reaching over 625 scale scores belong to the Advanced International Benchmark, 550 to 625 scores to the High International Benchmark, 475 to 550 to the Intermediate International Benchmark, and 400 to 475 to the Low International Benchmark.

The TIMSS and PIRLS International Study Center worked with the TIMSS 2007 Science and Mathematics Item Review Committee to conduct a detailed scale anchoring analysis to describe mathematics achievement at these benchmarks. Scale anchoring is a way of describing TIMSS 2007 performance at different points on the TIMSS mathematics scale in terms of the types of items students answered correctly. They also examined the mathematics content and cognitive processing dimensions assessed by each item and generalized to describe students' knowledge and understandings.

TIMSS 2007 International Benchmarks of Mathematics Achievement

34–41. pages

This chapter presents the TIMSS 2007 International Benchmarks for fourth and eighth grades. Each of the international benchmarks is described with two illustrative items selected from items released for public use. For each example item, the percent correct for each of the TIMSS 2007 participating country is given (See chapter Example Mathematics Items). There are more example items released for public use on the Hungarian TIMSS website (www.timss.hu).

TIMSS 2007 International Benchmarks of Mathematics Achievement for Fourth Grades

Advanced International Benchmark – above 625

Students can apply their understanding and knowledge in a variety of relatively complex situations and explain their reasoning. They can apply proportional reasoning in a variety of contexts. They demonstrate a developing understanding of fractions and decimals. They can select appropriate information to solve multi-step word problems. They can formulate or select a rule for a relationship. Students can apply geometric knowledge of a range of two- and three-dimensional shapes in a variety of situations. They can organize, interpret, and represent data to solve problems.

High International Benchmark – 550-625

Students can apply their knowledge and understanding to solve problems. Students can solve multi-step word problems involving operations with whole numbers. They can use division in a variety of problem situations. They demonstrate understanding of place value and simple fractions. Students can extend patterns to find a later specified term and identify the relationship between ordered pairs. Students show some basic geometric knowledge. They can interpret and use data in tables and graphs to solve problems.

Intermediate International Benchmark – 475-550

Students can apply basic mathematical knowledge in straightforward situations. Students at this level demonstrate an understanding of whole numbers. They can extend simple numeric and geometric patterns. They are familiar with a range of two-dimensional shapes. They can read and interpret different representations of the same data.

Low International Benchmark – 400-475

Students have some basic mathematical knowledge. Students demonstrate an understanding of adding and subtracting with whole numbers. They demonstrate familiarity with triangles and informal coordinate systems. They can read information from simple bar graphs and tables.

TIMSS 2007 International Benchmarks of Mathematics Achievement for Eighth Grades

Advanced International Benchmark – above 625

Students can organize and draw conclusions from information, make generalizations, and solve non-routine problems. They can solve a variety of ratio, proportion, and percent problems. They can apply their knowledge of numeric and algebraic concepts and relationships. Students can express generalizations algebraically and model situations. They can apply their knowledge of geometry in complex problem situations. Students can derive and use data from several sources to solve multi-step problems.

High International Benchmark – 550-625

Students can apply their understanding and knowledge in a variety of relatively complex situations. They can relate and compute with fractions, decimals, and percents, operate with negative integers, and solve word problems involving proportions. Students can work with algebraic expressions and linear equations. Students use knowledge of geometric properties to solve problems, including area, volume, and angles. They can interpret data in a variety of graphs and table and solve simple problems involving probability.

Intermediate International Benchmark – 475-550

Students can apply basic mathematical knowledge in straightforward situations. They can add and multiply to solve one-step word problems involving whole numbers and decimals. They can work with familiar fractions. They understand simple algebraic relationships. They demonstrate understanding of properties of triangles and basic geometric concepts. They can read and interpret graphs and tables. They recognize basic notions of likelihood.

Low International Benchmark – 400-475

Students have some knowledge of whole numbers and decimals, operations, and basic graphs.

Percentage of Students Reaching the TIMSS 2007 International Benchmarks of Mathematics Achievement

Exhibits 5 and 6 display the percentage of students in each country that reached each international benchmark. Students at higher international benchmarks achieved also the lower benchmarks, thus percentage of students reaching lower international benchmarks include the students performed on the higher levels as well. At each grade, the results are presented in descending order according to the percentage of students reaching the Advanced International Benchmark.

Generally the descending order of the percentage of the students reaching the Advanced International Benchmark (as Exhibit 5 and 6 display) is similar to the order of the average score of the countries. Thus, Far East countries had the highest percentages of students reaching the advanced benchmark and appear at the top. In particular, at the fourth grade, Singapore and Hong Kong SAR, at the eighth grade, Chinese Taipei, Korea and Singapore had more than 40 percent of their students achieving at or above the Advanced International Benchmark. It is above the international median of students reaching the High International Benchmark, and more than the percentages of Hungarian students, who are also among the good performers, reaching the High International Benchmark.

At the fourth grade Following Singapore and Hong Kong SAR, Chinese Taipei and Japan had nearly one-fourth of their students reaching the advanced benchmark. Other countries with at least 10 percent of fourth grade students reaching the advanced benchmark included Kazakhstan, England, the Russian Federation, Latvia, the United States and Lithuania. Hungary has almost this percentage of students reaching the advanced benchmark (9%). Hungary, similarly to Australia, Armenia, Denmark, the Netherlands and Germany, is among the countries which performed above the international median, i.e. Hungary with the percentage of students reaching the Advanced International Benchmark are among the countries with good performance.

30., 31. pages

At the eighth grade, following Chinese Taipei, Korea, and Singapore, more than one-fourth of students in Hong Kong SAR and Japan reached the advanced benchmark (31, and 26%, respectively). After a gap to the next highest percent, there is Hungary having 10 percent of students reaching the advanced benchmark.

The exhibits also convey information about the distribution of low performers, or those who do not reach even the low benchmark, students who struggle with serious inefficiencies.

At the fourth grade, the median for the Low International Benchmark was 90 percent, indicating that in half of the countries at least 90% of the fourth grade students had elementary knowledge and skills in mathematics, even a number of countries had 95 percent or more of students reaching this benchmark. Hungary had 88 percent of students reaching the low benchmark, which does not differ significantly from the median. However, it is quite low compared to the results of Hungarian students on TIMSS scale average. There are a number of countries with lower average achievement on the scale than Hungary's with higher percentage of students reaching the low benchmark.

At the other end of the achievement distribution, however, there are countries, mainly some of the Latin American and Middle East countries, where less than half of the students reached the low benchmark.

At the eighth grade, the international median is 75 percent for the students reaching the Low Benchmark. There are four countries with 95 percent or more students achieving this benchmark (Chinese Taipei, Korea, Singapore, and Japan). In Hungary, 91 percent of students reached this level, thus Hungary is well above the international average. There are 15 participating countries where less than half of students reached the low benchmark.

Trends Across the Four Benchmarks

32., 33. pages

Countries that participated in more assessment cycles can be analysed in terms of trends across the four benchmarks. The results are displayed in Tables 4 and 5.

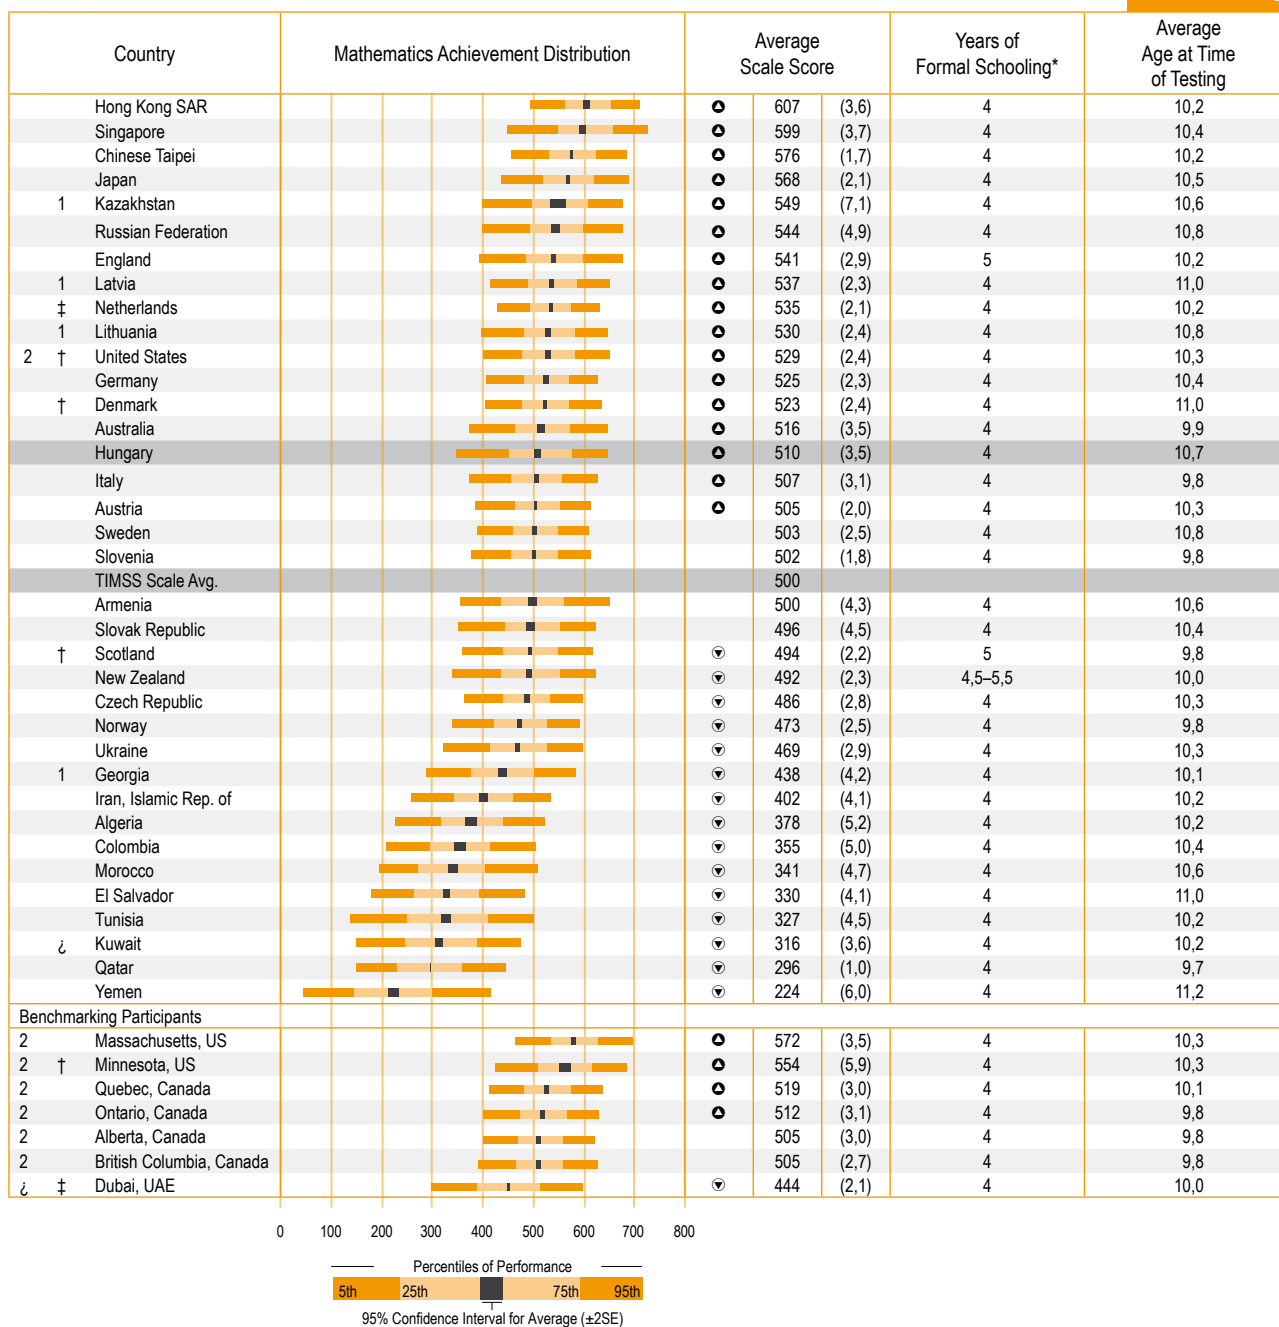

Most of the participating countries show significant change in a benchmark. In those countries where the average score changed significantly, similar patterns can be found in reaching most of the benchmarks. For example, at the fourth grade, Hong Kong SAR had increased percentages of students at each of the benchmarks (except at the low benchmark already reached by 99 per cent of the students in 2003). Hungary, with significantly lower achievement in 2007 compared to the previous cycles, stayed at the same level considering the percentage of students reaching the advanced benchmark. There was a six-percent decrease in the number of students reaching the high benchmark in 2007 compared to 2003. Similarly, there was a nine-percent decline in the number of students reaching the intermediate benchmark in 2007 compared to 2003. There was an increase in number of students not reaching even the low benchmark in 2007.

At the eighth grade, there were fewer Hungarian students reaching each of the benchmarks compared to the results in 2003, except for the advanced benchmark, where there was no significant change in the results. Compared to the results to those in 1999, there was no significant change in the number of students reaching the Low International Benchmark, but percentages declined in all other benchmarks. Comparing results to those in 1995, it can be concluded that there was no significant change in the results at the Advanced and the High International Benchmarks. However, there was a decline in the number of students achieving the lower benchmarks. In conclusion, the lower overall average achievement of Hungarian students resulted from the weaker performance of students at the lower benchmark.

Trend notes: Data are not shown for Kuwait, Morocco, Saudi Arabia, and Turkey, because comparable data from previous cycles are not available. Data for Indonesia do not include Islamic schools.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (—) indicates comparable data are not available.

A diamond (◊) indicates the country did not participate in the assessment.

◊ 2007 percent significantly higher.

◊ 2007 percent significantly lower.

EXAMPLE ITEM

Example Item 1 Advanced International Benchmark (above 625 point) of Mathematics Achievement

TIMSS 2007
Mathematics **4**

Content Domain: Number

Description: Writes two-step rule for a linear relationship between pairs of numbers.

Sean used the same rule to get the number in the from the number in the .

What was the rule?

Answer: You double the number and add one.

Example: $2 \cdot 4 = 8$
 $8 + 1 = 9$

The answer shown illustrates the type of student response that was given full credit.

Example Item 3 High International Benchmark (between 550-625 point) of Mathematics Achievement

TIMSS 2007
Mathematics 4

Content Domain: Number

Description: Determines the missing digit to give a specified difference in a three-digit subtraction problem.

$$\begin{array}{r} 942 \\ -5\text{ }7 \\ \hline 415 \end{array}$$

Mano did the subtraction problem above for homework but spilled some of his drink on it. One digit could not be read. His answer of 415 was correct. What is the missing digit?

Answer: 2

The answer shown illustrates the type of student response that was given full credit.

Example Item 9 Advanced International Benchmark (above 625 point) of Mathematics Achievement

TIMSS 2007
Mathematics 8

Content Domain: Algebra

Description: Solves a word problem that can be expressed as two linear equations with two variables.

Joe knows that a pen costs 1 zed more than a pencil. His friend bought 2 pens and 3 pencils for 17 zeds. How many zeds will Joe need to buy 1 pen and 2 pencils?
Show your work.

Pencil: x zed

Pen: $y = x + 1$ zed

$$2y + 3x = 17$$

$$2(x + 1) + 3x = 17$$

$$2x + 2 + 3x = 17 \quad | -2$$

$$5x = 15 \quad | :5$$

$$x = 3$$

One pencil costs 3 zed..

$$y = x + 1$$

$$y = 3 + 1 = 4$$

One pen costs 4 zed.

$$x + 2y = 4 + 2 \cdot 3 = 4 + 6 = 10$$

One pen and two pencils cost 10 zeds.

The answer shown illustrates the type of student response that was given full credit.

SCIENCE

OVERVIEW

The TIMSS 2007 Assessment Frameworks⁸ contain the science framework summarizing the theoretical background of the construction of the science test. This chapter presents the main points of the science framework.

At both grades science assessment is organized around two dimensions, content and cognitive domains. The content dimension specifies the domains or subject matter to be assessed within science. The content domains differ for the two grades. At fourth grade, Life Science receives more emphasis. At eighth grade, physics and chemistry are assessed as separate content domains, and receive more emphasis than at fourth grade, where they are assessed as one content domain, physical science. Cognitive dimensions – specifying the domains of thinking process – are the same for both grades since they require similar cognitive processes from students participating in the assessment at eighth or fourth grade.

First, the structure of subject domains then the cognitive domains will be described shortly. For more detailed description of the framework see Appendix.

Science Content Domains

TIMSS observing the curricular differences in the participating countries, defined three science content domains which cover the science topic areas to be assessed in TIMSS 2007: Life Science, Physical Science, Earth Science.

The framework contains the topic areas of each content domain.

LIFE SCIENCE ~ Characteristics and life processes of living things; life cycles, reproduction, and heredity; interaction with the environment; ecosystems; human health.

PHYSICAL SCIENCE ~ Classification and properties of matter; physical states and changes in matter; energy sources, heat, and temperature; light and sound; electricity and magnetism; forces and motion.

EARTH SCIENCE ~ Earth's structure, physical characteristics, and resources; Earth's processes, cycles, and history; Earth in the solar system.

Table IV displays the number of items in the three content domains and the maximum scores for each item with percentages of the overall assessment.

Table IV Distribution of Test Items by Content Domains, Fourth Grade

Content Domain	Number of Items	Score to be Achieved
Life Science	74	85 (44%)
Physical Science	64	67 (35%)
Earth Science	36	42 (21%)
Total	174	194 (100%)

Four major content domains – biology, chemistry, physics, and Earth science – define the science content covered in the eighth-grade assessment. It is important to note, however, that in an international assessment such as TIMSS the organization of science topics into these domains does not correspond to the structure of science instruction in all countries. In many countries, for example, science is taught as general science or integrated science whereas in others, in Hungary for example, science is taught as separate subjects. This difference is usually considered when analysing background data or different variables so countries where science is taught as integrated subject are displayed in one group and countries where science is taught as separate subjects are shown in another group.

⁸ Mullis, I.V.S. et al.:TIMSS 2007 Assessment Frameworks. TIMSS & PIRLS International Study Center, Lynch School of Education, Boston College, 2005.

Each content domain comprises several main topic areas.

BIOLOGY ~ Characteristics, classification, and life processes of organisms; cells and their functions; life cycles, reproduction, and heredity; diversity, adaptation, and natural selection; ecosystems; human health.

CHEMISTRY ~ Classification and composition of matter; properties of matter; chemical change.

PHYSICS ~ Physical states and changes in matter; energy transformations; heat and temperature; light; sound; electricity and magnetism; forces and motion.

EARTH SCIENCE ~ Earth's structure and physical features; Earth's processes, cycles, and history; Earth's resources, their use and conservation; Earth in the solar system and the universe.

Table V shows the number of items in the four content domains and the maximum scores for each item with percentages of the overall assessment.

Table V Distribution of eTest Items by Content Domains, Eighth Grade

Content Domain	Number of Items	Score to be Achieved
Biology	76	89 (37%)
Chemistry	42	46 (19%)
Physics	55	59 (25%)
Earth Science	41	46 (19%)
Total	214	240 (100%)

Cognitive Domains

To respond correctly to TIMSS 2007 test items students needed skills which can be divided into three main domains: Knowing, Applying, Reasoning.

KNOWING ~ Recall and recognize; define; describe; illustrate with examples; use tools and procedures.

APPLYING ~ Compare, contrast, classify; use models; relate; interpret information; find solutions; explain.

REASONING ~ Analyze, solve problems; integrate, synthesize; hypothesize, predict; design, plan; draw conclusions; generalize; evaluate; justify.

Table VI displays the number of items in the three cognitive domains and the maximum scores for each item with percentages of the overall assessment.

Table VI Distribution of Test Items by Cognitive Domain

Grade	Cognitive Domains	Number of Items	Score to be Achieved
4.	Knowing	77	89 (46%)
	Applying	63	68 (35%)
	Reasoning	34	37 (19%)
	Total	174	194 (100%)
8.	Knowing	84	89 (37%)
	Applying	86	97 (40%)
	Reasoning	44	54 (23%)
	Total	214	240 (100%)

RESULTS AND TRENDS

In this chapter the results of the TIMSS 2007 Science assessment will be displayed. It contains the average achievements of students at fourth and eighth grades in the participating countries, the distribution of students' achievements, the students' achievements by content and cognitive domains, as well as the comparison of the achievements of the previous assessment cycles – in 1995, 1999 and 2003 – and the results of TIMSS 2007 assessment.

Results and Differences

Exhibits 7 and 8 display the distribution of the achievement of students from the participating countries in TIMSS 2007 assessment. Countries are shown in a descending order of their average achievements. The graph shows the average scale scores of the participating countries with its 95 percent confidence interval and the ranges in performance for the middle 50 percent of the students (25th to 75th percentiles) as well as the extremes (5th and 95th percentiles). Next to the graphically displayed distribution of achievements, the average scale scores of the countries and the standard errors are shown in the column numerically.

Although the achievements are displayed on a scale with a mean of 500 and a standard deviation of 100 for each grade, it should be noted that the results for the fourth and eighth grades are not directly comparable.

Similar to earlier TIMSS assessments, the four Far East countries, Singapore (587), Chinese Taipei (557), Hong Kong SAR (554) and Japan (548) have the best results. Singapore was the top performing country, the average achievement of its students is significantly better than that of any other participating country in the assessment.

The achievement of Hungarian students at fourth grade (536) is among the best performances. Only the four top-performing Asian countries have statistically significantly better results than Hungarian students. This result is especially remarkable in the light of considering the fact that significant part of the subject domains in the assessment are not or little covered in the Hungarian curricula compared to other countries. This achievement is among the best not only in the region but also in Europe.

Norway is the only participating country among the developed European countries with a significantly lower achievement (477 score point) than the TIMSS scale average of 500.

At eighth grade, Singapore (567) and Chinese Taipei (561) achieved the best results in the science assessment with more than 60 scale scores higher than the TIMSS average of 500. The 6-point difference between them is statistically irrelevant, their performance is equal. The achievements of Japan and South Korea are slightly lower than that of Singapore but statistically the same as that of Chinese Taipei. These four countries top the achievement table of the 59 participating countries.

The performance of Hungarian students at eighth grade is also on a high level in the science assessment. In Europe, they achieved the best results together with students from England, the Czech Republic and Slovenia (539), and similarly to fourth grades, only the top-performing four Far East countries achieved significantly better results.

The fourth and fifth columns in Exhibits 7 and 8 display the grades and average ages of students assessed in the participating countries. Although, there is a positive link between a student's age and their performance, the different achievement results of the participating countries cannot be explained by the differences of students' ages. The characteristics of education systems have bigger impact on the performance of students than students' ages do.

53., 54. pages

The TIMSS science scales for the fourth and eighth grades were established based on the performance of students in the 1995 assessments with an international mean of 500 and a standard deviation of 100. Since the ranges of the participating countries and the average achievements of the countries can be varied from one assessment cycle to another, instead of changing the scale each time, the 1995 assessment scale is used in the 1999, the 2003 and the 2007 assessments. Therefore, the TIMSS scale average of 500, which is noted several times in our report, is not equal with the international average achievement score of the participating countries in the 2007 assessment cycle.

How Has Science Achievement Changed Since 1995, 1999 and 2003?

55–58. pages

Exhibits 9 and 10 compare the TIMSS 2007 assessment results and achievements and the results of previous assessment cycles in countries which participated in any of them. Both exhibits present the countries in decreasing order of their average achievements. At fourth grade, there are 23 participating countries with comparable science data from 1995 or 2003, or from both assessment cycles. At eighth grade, there was an additional science assessment in 1999 as well. 27 countries have comparable data from all the four assessment cycles (1995, 1999, 2003 and 2007), and there are 36 countries with data from at least one previous assessment cycle which can be compared to the results of TIMSS 2007.

In addition to displaying the average scores of each assessment cycle in the second columns, Exhibits 9 and 10 also present the differences between the results of TIMSS 2007 and previous assessments in the third and the fourth columns (at eighth grade in the fifth column as well). Also in the same columns, if the TIMSS 2007 assessment result is significantly better than that of previous assessments it is indicated with an up arrow, if it is significantly lower than the result from previous cycles it is indicated with a down arrow. If there is no symbol, it means that there is no significant difference between the results of compared assessment cycles.

At fourth grade, there are seven countries showing significant improvement in achievement in 2007 compared to the first, the TIMSS 1995 assessment results. Five out of these countries – Singapore, Hong Kong SAR, Latvia, Slovenia and Iran – show a continuous improvement in the complete 12-year period, between 1995 and 2007, with reaching or outperforming the 50-point (half a standard deviation) scale scores (46-63 scale scores).

Hungary is among the 8 participating countries that show improvement in fourth-grade science assessment results in TIMSS 2007 compared to 1995. In Hungary this significant improvement can be seen between 1995 and 2003. The six-point increase between 2003 and 2007 is within the standard error, so it is insignificant.

Although to a smaller extent than the above mentioned countries show increase, five countries show decline in achievements (5-27 scale scores) – Japan, Austria, the Czech Republic, Scotland and Norway.

At eighth grade, compared to the fourth grade, there are fewer countries and with smaller degrees of change that show any changes. Between 1995 and 2007 South Korea (+7), Slovenia (+24), Hong Kong SAR (+10), Lithuania (+55) and Colombia (+52) show increase, and there are only three countries Norway (-28), the Czech Republic (-16) and Sweden (-42) showing decline.

The Hungarian students' average performance does not show significant change in the 12-year assessment period. On the other hand, the three assessment cycles show fluctuations; between 1995 and 1999 there was a 15-point increase which was followed by a 9-point decrease between 1999-2003, and there was no significant change between 2003-2007 with a 4-point decrease.

Trends Across Grades: Fourth to Eighth Grade Cohort Analysis

Because TIMSS is conducted on a four-year cycle, the cohort of students that was assessed in the fourth grade in 2003 had reached the eighth grade by 2007. This enables the 17 countries that assessed both grades in both assessments to examine how their performance relative to each other changed.

The performance of the fourth grades and the eighth grades in 2003 and 2007 cannot directly be compared since the achievement scales are different in each grade. However, the relative order of the countries' achievement can be analysed, changes and relative rankings of the participating countries within one grade and from fourth grade to eighth grade can be discussed here.

The four small tables of Table 6 show the average science achievements of the 17 countries in descending order for these grades in 2003 and 2007. Triangles pointing upward indicate that the country average is significantly higher than TIMSS scale average; triangles pointing downward indicate that the country average is significantly lower than TIMSS scale average.

It can be noted that most countries do not show significant changes in their rankings in the four tables. It should also be noted that there are countries which improved in both cycles at both grades. Logically, the cohort analysis in these countries also shows relative improvement of the performance of

59. page

the fourth grades in 2003 and the eighth grades in 2007. For example, Slovenia, which shows significant improvement in both the fourth and eighth grades, 20 and 18 scale scores, respectively. Thus, the performance at the fourth grade, which was below the average in 2003, improved significantly, and it was higher than the average at the eighth grade in 2007. It also meant a higher ranking in the relative order of the participants.

In addition to this, Slovenia is one of the education systems where the eighth grades reached better results in both assessment cycles than the fourth grades. It is likely the consequence of their curricular structure. On the contrary, in Italy the eighth grades had lower achievements in both assessment cycles.

In the case of Hungary there is only a small, statistically not relevant change in the ranking in the relative order.

Achievements in content and cognitive domains

As described in the overview, the science assessment is organized around two dimensions, the content and the cognitive domains. Every question can be associated with a content domain (Biology, Physics, Chemistry, Earth Science) and a cognitive domain (Knowing, Applying, Reasoning) according to what students need to answer the question. This association provides the possibility for both content-based and cognitive-oriented analysis of student achievement in science.

Tables 7 and 8 display the average achievements of students from the participating countries by the content and cognitive domains. The countries are listed in alphabetical order in the Tables. To simplify comparisons of student achievement across domains, the content and cognitive achievement scales at each grade were placed on a scale with a mean of 500 and a standard deviation of 100 in the first cycle of the TIMSS in 1995. Triangles pointing upward indicate that the country average is significantly higher than 500-scale average; triangles pointing downward indicate that the country average is significantly lower than 500-scale average.

The average achievements in the different content and cognitive domains cannot be directly compared, i.e. it cannot be said, for example that students from a country are better in the Physics content domain than in the Biology content domain because items of each domain have different characteristics. On the other hand, the relative rankings of participating countries, i. e. the average scale scores compared to the TIMSS scale average can be analysed. Based on this the weaknesses and strengths of particular countries related to others can be seen.

It can be concluded that there are higher differences in the performances of countries in the cognitive domains than in the performances of countries in the content domains.

It is noteworthy that the high rankings of the Asian countries are based on their results in the Physical Science content domain, since Singapore, Japan, Chinese Taipei and Hong Kong SAR have the highest scale scores in this domain. However, only Singapore could reach outstanding results in all three content domains.

Hungarian students at fourth grade are among the top-performing ones, and reached the best results in the Life science content domain together with Singapore and Italy. Also, they performed above the TIMSS scale average in the two other content domains. Comparing the results in the three content domains to the overall average score, it can be noted that Hungarian students have better results in the Life science content domain than in the overall achievement scale, in the Physical science content domain the results do not differ significantly, and in the content domain of Earth Science Hungarian students' scale score is significantly lower than their overall score.

Singapore is also the best performing country concerning the three cognitive domains at fourth grades. Similarly to Physical science in the content domains, among the cognitive domains it is the Reasoning where the best performing Asian countries proved to be the strongest among all participating countries.

As expected, the Hungarian students reached the best score in the cognitive domain of Knowing.

Comparing data at the eighth grade, one can reach a similar conclusion. Outstanding performance here is based on the outstanding results in the Physics content domain and the Reasoning cognitive domain. In addition to the Far East countries, Australia, England, Lithuania, Slovenia, Sweden and the United States scored the highest in the Reasoning cognitive domain. At eighth grade Hungarian students were the only ones who reached high overall average achievement by performing best in the Applying cognitive domain.

60–61. pages

Hungarian students' average scores are significantly above the TIMSS scale average of 500 in every content domain, with the Physics content domain slightly outperform the rest.

8th grade Hungarian students were the most efficient in Applying among the cognitive domains. There is no available data as basis for comparison from previous assessment cycles, but compared to fourth grade, where recalling knowledge is the strongest suit of our students, this is an improvement nevertheless.

SCIENCE ACHIEVEMENT SCALE, TIMSS 2007 INTERNATIONAL BENCHMARKS AND PERCENTAGE OF STUDENTS REACHING EACH INTERNATIONAL BENCHMARK

The TIMSS science achievement scale designed by the student contextual knowledge and cognitive abilities. To interpret and compare the results more easily, four benchmarks have been determined on the scale. The TIMSS has determined four benchmarks for both grades, and described the students knowledge and abilities on each benchmarks. Students reaching over 625 scale scores belong to the Advanced International Benchmark, 550 to 625 scores to the High International Benchmark, 475 to 550 to the Intermediate International Benchmark, and 400 to 475 to the Low International Benchmark.

Before describing international benchmarks TIMSS conducted a detailed scale anchoring analysis to describe science achievement at these benchmarks. Scale anchoring is a way of describing TIMSS 2007 performance at different points on the TIMSS science scale in terms of the types of items students answered correctly. In order to determine the benchmarks, beyond the data analysis component there was a judgmental component in which the SMIRC (TIMSS 2007 Science and Mathematics Item Review Committee) members examined the science content and cognitive processing dimensions assessed by each item and generalized to describe students' knowledge and understandings.

This chapter presents the four international benchmarks in science for fourth and eighth grades, also, examines the comparability of the results in the participating countries with the help of international benchmarks, then there are some example test items to complete the description of the benchmarks.

TIMSS 2007 International Benchmarks of Science Achievement

What science knowledge and problem-solving skills can be expected from students at fourth and eighth grades at the four TIMSS 2007 international benchmarks? At each grade, there was a substantial variation in performance between students achieving at the high and the low ends of the scale.

TIMSS 2007 International Benchmarks of Science For Fourth Grades

Advanced International Benchmark – above 625

Students can apply knowledge and understanding of scientific processes and relationships in beginning scientific inquiry. Students communicate their understanding of characteristics and life processes of organisms as well as of factors relating to human health. They demonstrate understanding of relationships among various physical properties of common materials and have some practical knowledge of electricity. Students demonstrate some understanding of the solar system and Earth's physical features and processes. They show a developing ability to interpret the results of investigations and draw conclusions as well as a beginning ability to evaluate and support an argument.

High International Benchmark – 550-625

Students can apply knowledge and understanding to explain everyday phenomena. Students demonstrate some understanding of plant and animal structure, life processes, and the environment and some knowledge of properties of matter and physical phenomena. They show some knowledge of the solar system, and of Earth's structure, processes, and resources. Students demonstrate beginning scientific inquiry knowledge and skills, and provide brief descriptive responses combining knowledge of science concepts with information from everyday experience of physical and life processes.

Intermediate International Benchmark – 475-550

Students can apply basic knowledge and understanding to practical situations in the sciences. Students recognize some basic information related to characteristics of living things and their interaction with the environment, and show some understanding of human biology and health. They also show some understanding of familiar physical phenomena. Students know some basic facts about the solar system and have a developing understanding of Earth's resources. They demonstrate some ability to interpret information in pictorial diagrams and apply factual knowledge to practical situations.

Low International Benchmark – 400-475

Students have some elementary knowledge of life science and physical science. Students can demonstrate knowledge of some simple facts related to human health and the behavioural and physical characteristics of animals. They recognize some properties of matter, and demonstrate a beginning understanding of forces. Students interpret labelled pictures and simple diagrams, complete simple tables, and provide short written responses to questions requiring factual information.

TIMSS 2007 International Benchmarks of Science for Eighth Grades

Advanced International Benchmark – above 625

Students can demonstrate a grasp of some complex and abstract concepts in biology, chemistry, physics, and Earth science. They have an understanding of the complexity of living organisms and how they relate to their environment. They show understanding of the properties of magnets, sound, and light, as well as demonstrating understanding of structure of matter and physical and chemical properties and changes. Students apply knowledge of the solar system and of Earth's features and processes, and apply understanding of major environmental issues. They understand some fundamentals of scientific investigation and can apply basic physical principles to solve some quantitative problems. They can provide written explanations to communicate scientific knowledge.

High International Benchmark – 550-625

Students can demonstrate conceptual understanding of some science cycles, systems, and principles. They have some understanding of biological concepts including cell processes, human biology and health, and the interrelationship of plants and animals in ecosystems. They apply knowledge to situations related to light and sound, demonstrate elementary knowledge of heat and forces, and show some evidence of understanding the structure of matter, and chemical and physical properties and changes. They demonstrate some understanding of the solar system, Earth's processes and resources, and some basic understanding of major environmental issues. Students demonstrate some scientific inquiry skills. They combine information to draw conclusions, interpret tabular and graphical information, and provide short explanations conveying scientific knowledge.

Intermediate International Benchmark – 475-550

Students can recognize and communicate basic scientific knowledge across a range of topics. They demonstrate some understanding of characteristics of animals, food webs, and the effect of population changes in ecosystems. They are acquainted with some aspects of sound and force and have elementary knowledge of chemical change. They demonstrate elementary knowledge of the solar system, Earth's processes, and resources and the environment. Students extract information from tables and interpret pictorial diagrams. They can apply knowledge to practical situations and communicate their knowledge through brief descriptive responses.

Low International Benchmark – 400-475

Students can recognize some basic facts from the life and physical sciences. They have some knowledge of the human body, and demonstrate some familiarity with everyday physical phenomena. Students can interpret pictorial diagrams and apply knowledge of simple physical concepts to practical situations.

Percentage of Students Reaching Each International Benchmark of Science Achievement

62., 63. pages

Exhibits 11 and 12 display the percentages of students reaching each of the four TIMSS international benchmarks in science. The percentages illustrated graphically and shown in the table are cumulative, thus for example the number of students reaching the intermediate benchmark includes the percentage of students performing on the high benchmark and the percentage of students performing on the advanced benchmark (their score point is above 475). At each grade, the results are presented in descending order according to the percentage of students reaching the Advanced International Benchmark. Generally, the TIMSS 2007 participants with the highest average achievement had greater percentages of students reaching the advanced international benchmark, and lower achieving countries had smaller percentages. Singapore excels here as well, especially at fourth grade where percentage of students reaching the advanced international benchmark is almost twice as high as in Chinese Taipei which is the next country in order according to the average achievements. In general, it can be concluded that percentage of high-achieving students in the Asian countries is high, and according to TIMSS assessment results more than half of students in these countries reached the High International Benchmark.

Hungarian students with remarkable achievement among the European countries had similar results at the two grades. The effectiveness of the education system was among the top-performers together with England, Russia, the Czech Republic and Slovenia.

As a reference point, the exhibits also display the median for each of the four benchmarks. This is a percentage which is smaller than the percents of the students reached the given benchmark in half of the countries, and higher than the percents of the students reached the given benchmark in the other half of the countries. The median of the High International Benchmark is 7% at the fourth grade, and 3% at the eighth grade. At both grades, 13 percent of the Hungarian students achieved at this benchmark.

Although the exhibit is organized to draw particular attention to the percentage of high-achieving students in each country and benchmarking participant, it also conveys information about the distribution of middle and low performers. At the fourth grade, the median for the Low International Benchmark was 93 percent, indicating that in at least half the countries almost all of the fourth grade students had elementary knowledge and skills in science. The Hungarian result was consistent with the median, which is a slightly smaller than it can have been expected on the base of their average achievement result. There were a number of countries, which had lower average achievement results, with higher percentage of students reaching the Low International Benchmark than Hungary. According to the TIMSS assessment results, seven percent of Hungarian students did not reach the Low International Benchmark in science, i.e. did not reach 400 score points.

At eighth grades, the distribution of Hungarian students reaching each international benchmark is slightly different from the results at fourth grades. Nevertheless, this little difference becomes relatively important in international comparison. The percentage of students not reaching the lowest level is fairly low (4%), with this result Hungarian students are at the similar level as the best performer Asian countries, in fact, they outperformed Singapore (7%).

Trends

64., 65. page

Tables 9 and 10 present trends across the benchmarks, whether there have been significant changes across the previous assessments in the percentage of students reaching the benchmarks.

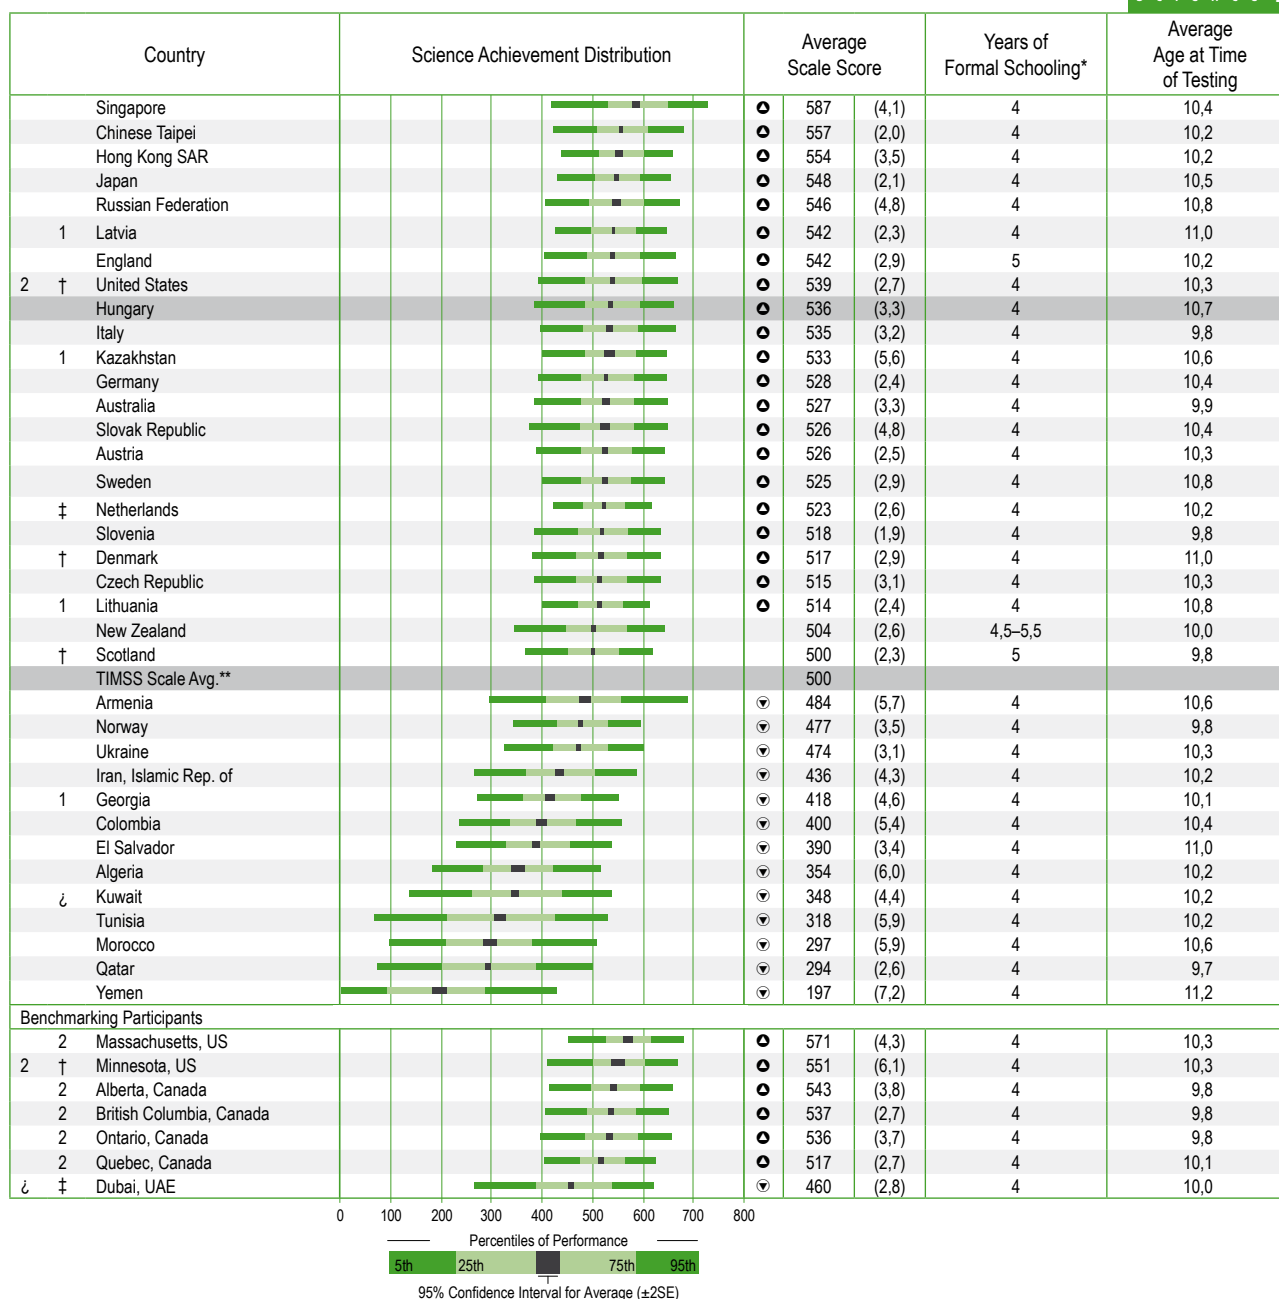

At the fourth grade, in addition to Singapore, Hong Kong SAR, and Slovenia, Hungary is the fourth country where the percentage of students achieving at each of the benchmarks increased continuously between 1995 and 2007.

At the eighth grade, countries showing the most remarkable improvement at each benchmark included Korea, Slovenia and Lithuania. Hungarian percentages do not show significant changes at any of the four benchmarks across the assessment cycles.

Description: Recognizes that, regardless of their size, ice cubes float in water.

Susie has three ice cubes of different sizes. She places each ice cube into an identical beaker containing the same volume of water, as shown in the diagram.

What happens to the ice cubes when they are placed in the water?

- ☐ A Cubes 1, 2, and 3 will sink.
☒ B Cubes 1, 2, and 3 will float.
☐ C Cube 1 will float, and cubes 2 and 3 will sink.
☐ D Cubes 1 and 2 will float, and cube 3 will sink.

Content Domain: Life Science

Description: Explains that the last surviving member of a species of a turtle cannot reproduce and gives a reason.

There is a giant turtle that lives on an island. He is the only turtle left of a special type of giant turtle.

Can he reproduce so that this type of turtle does not die out?

(Check one box.)

- ☐ Yes
☒ No

Give a reason for your answer.

Turtles cannot reproduce all by themselves. It is a male turtle so he needs on female.

Example Item 21 Intermediate International Benchmark (between 475-550 points)
of Science Achievement

TIMSS 2007
Science 4

Content Domain: Life Science

Description: In the context of an investigation of plant growth, describes a treatment that can cause one plant to grow better than another.

Carl and Jan each had a sunflower seed taken from the same plant. They took two identical pots and put potting soil in each. They then planted one seed in each pot. Carl looked after one pot in his home, and Jan looked after the other pot in her home.

After some time, they compared the plants and saw that there was a large difference in their growth, as shown in the pictures below.

Carl's plant

Jan's plant

Describe one way in which Carl may have treated his plant differently from the way Jan treated hers.

Carl might have given it more light and water.

The answer shown illustrates the type of student response that was given full credit.

Description: From a diagram showing a person blowing into water using a straw, explains why bubbles rise to the top.

When you blow into water using a straw, bubbles are formed and rise to the top.

Why do the bubbles rise in water?

They rise because they are made from air which is lighter than water.

The answer shown illustrates the type of student response that was given full credit.

Description: Applies knowledge of conservation of mass during a chemical reaction to explain what happens to mass when a new substance is formed.

The mass of substances A and B are measured on a balance, as shown in Figure 1. Substance B is put into the beaker and substance C is formed. The empty beaker is put back on the balance, as shown in Figure 2.

The scale in Figure 1 shows a mass of 110 grams. What will it show in Figure 2?
(Check one box.)

- ☐ More than 110 grams
☒ 110 grams
☐ Less than 110 grams

Explain your answer.

The mass will be the same because the mass of reactants equals the mass of products.

The answer shown illustrates the type of student response that was given full credit.

FACTORS INFLUENCING STUDENT ACHIEVEMENT

TIMSS 2007 did not only assess students' performance at four and eighth grades in mathematics and science but also examined home and school background factors. Students, their teachers and school principals were asked to complete questionnaires to provide information about school and home background, students' learning experiences, and teachers' practices.

This chapter presents information about factors that can have an impact on students' learning mathematics and science, as well as factors that can influence their skills in these subjects.

HOME BACKGROUND⁹

The educational level of parents

The performance of students is associated with the educational level of their parents – higher level of parents' education is associated with higher average achievement in mathematics and in science in general (Table 11).¹⁰ This statement can be applied to all participating countries in both assessment areas.

On the other hand, it can be noted, that there are significant differences across countries according to the students' average achievement whose parents have the highest level of education (university degree or above) compared to the average achievement of students with parents of the lowest level of education (below lower secondary). The higher the difference in average achievements of students with parents of different levels of education within a country, the less equal opportunity the country provides, and it can result in the polarization of knowledge. It means that students whose parents have lower educational level are put at a significant disadvantage in terms of achieving higher level of education compared to those students whose parents have higher educational level, which can conserve and determine students' status and position in the society in the long run.

As mentioned before, there were 12 countries whose students performed above the TIMSS 500 scale average in mathematics at eighth grade, including Hungary. In science, there were 14 countries above the TIMSS 500 scale average including Hungary.

In mathematics, the differences between the achievement of students with the lowest and students with the highest educational level of their parents are 42-104 score points in countries achieving significantly better results than Hungary. This difference in Hungary is significantly higher, 129 score points. Comparing the results of the participating countries it is only in Turkey where the standard deviation is above that of Hungary.

Data also show that the performance of Hungarian students in science is also more significantly influenced by their parents' educational attainment than in other participating countries. The difference between students with the lowest and the highest educational level of their parents is 112 score points. It is among the highest, only Turkey and Singapore has similar, or slightly higher deviation.

Consequently, the standard deviation of the participating countries in our region is below that of Hungary considering parents' educational attainment. In Slovenia the difference is 67 points, in the Czech Republic it is 48 points in mathematics.

The potential of the Far East countries achieving best in the TIMSS scale average is also proved by the fact that the average achievement of Hungarian students with the highest educational attainment of parents does not reach the level of the average achievement of students in these countries.

⁹ Questionnaires about family background were completed by students.

¹⁰ The educational level of the parent with more education was used in assigning students to categories; in case of single-parent families it was of the parent in question. This question was only applied to eighth grades.

79–80. pages

Computer and Internet connection at home

Possessing computer and Internet connection at home is strongly associated with the economic development and in some case some cultural aspects of the participating countries.

According to the students responses¹¹ in most of the European countries at both fourth and eighth grades more than 80 percent of students have a computer at home, and at least 60 percent had Internet connection at home. The distribution is not homogeneous; in Western European countries almost all of the students can access Internet from home, whereas in Central and Eastern European countries only 40 to 80 percent of students have Internet access at home.

In 2007, 81 percent of Hungarian fourth graders reported having computer at home and 54 percent reported having Internet connection. At eighth grade, 90 percent reported having computer and 62 percent reported having Internet connection at home.¹¹

Possessing a computer and/or Internet connection at home are among the variables which correlate with the average achievement of students in mathematics and science. This correlation can result from the use of computer applications and exploiting Internet in a positive way (checking some information, searching for some more information in relation to their studies at school). These activities can be seen as cultural background factors affecting learning. On the other hand, computer and Internet availability at home can be / is also indicative of the family's socio-economic status; families with computer and Internet connection might have economic advantage in general compared to those without such equipment and facilities.

In our view, the latter correlation plays a more important role in the effectiveness of learning, i.e. possessing computers and Internet connection reflect the better socio-economic status of families with more economic resources, and the economic advantage of families is strongly and closely related to better student achievements.

On average across countries at the fourth grade, students from homes with a computer had mathematics and science achievement 40 points above those from homes without a computer. At eighth grades, this difference is 53 points in mathematics, 46 points in science.

Students from homes with Internet connection performed better at both grades in both mathematics and science by 30-35 points on average than students without such facilities.

Data on the achievement of Hungarian students show that for those who have them, IT facilities at home increased the achievement substantially in the TIMSS achievement scale (42-67 score points), i.e. socio-economic differences have higher impacts on academic achievement. It does not relate to the results of Hungarian fourth graders in science where this advantage is equivalent to the international average.

In the region, except for Slovenia, the differences between the average achievements of students with computer and/or Internet connection at home and students without them are lower than in Hungary.

81., 82. pages

¹¹ These data provided by Hungarian students do not match the official Hungarian data on this field. The primary reason for this can be detected in the definition of the concept. Most students may have mixed up Internet availability at home and in the school. They likely provided answers on how much in general they can access the Internet and use computers. However, it is indifferent from the aspect of displaying the results since our primary goal was to map how much access to computers and the Internet affected test results.

Background data provided by students.

* Based on countries' categorizations to UNESCO's International Standard Classification of Education (Operational Manual for ISCED–1997).

** Includes postgraduate degrees (e.g., doctorate, master's, other postgraduate degree or diploma).

† Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (–) indicates comparable data are not available. A tilde (–) indicates insufficient data to report achievement.

Note: The distribution of students' reports on parents' educational levels may not match the distribution from national population statistics, particularly where large percentages of students report that they "Do not know" (e.g., Sweden).

SCHOOL CONTEXT

Percentages of students coming from socially and economically disadvantaged homes

To provide information about the students' family background, TIMSS asked school principals to estimate the percentage of students in their schools from economically disadvantaged homes (based on their personal opinion and their country's economic conditions within their own framework of reference).

At fourth grade, according to school principals, in average 60 percent of students attended schools with not more than 25 percent of economically disadvantaged students, 17 percent attended schools with 26 to 50 percent economically disadvantaged students, and 23 percent attended schools where the majority were economically disadvantaged students.

At the eighth grade, the percentage of students attending schools with more economically disadvantaged students was slightly higher (52%). It is a consequence of the differences resulting from the socio-economic backgrounds of countries participating at the eighth and the fourth grade assessment. Within the particular countries data are similar at both grades.

According to the subjective estimate of school principals, the highest percentage of students live in better economic conditions in the developed countries (irrespective of geographical location) and, surprisingly, in Ukraine and Slovakia – in these countries students attended schools with lower than 10 percent of economically disadvantaged students. Countries where more than half the students attended schools where the majority of students were from disadvantaged backgrounds included Algeria, Colombia, El Salvador, Morocco, and Yemen (Table 14-17) have the students with the biggest economical disadvantage.

In Hungary, principals estimated that the percentage of students attending schools with lower than 10 percent of economically disadvantaged students is a little lower than the average (12-13%), and almost one third of students attended schools with 50 percent of economically disadvantaged students.

Comparing student achievement in different schools it can be concluded that average achievement was the highest among students attending schools with the fewest economically disadvantaged students (irrespective of grades and the field of assessment). They are followed by students attending schools with 11 to 25 percent of students with economic disadvantage, then students attending mixed schools according to their socio-economic status. Students from schools with the highest economically disadvantaged student population are at the weak end on the TIMSS achievement scale.

The same findings are reflected in the Hungarian data as well. At the fourth grade, students attending schools with less than 10 percent of economically disadvantaged students reached 80 points higher in mathematics, and 70 points higher in science, at the eighth grade, 60 points higher in mathematics and 50 points higher in science in the TIMSS 2007 study than students attending schools with over 50 percent of economically disadvantaged students.

These data also provide evidence for and complement the earlier conclusion: the economic resources (financial background) of parents have a substantial impact on TIMSS results.

85–92. pages

School Climate

TIMSS asked both school principals and teachers to characterize the climate of their school in terms of teachers and the school, parents and the school and students and the school.

An own index¹² was created in order to simplify interpretation of the results and used at teachers' and principals' answers too. According the School Climate index three categories were developed, and the schools were classified into these. The High, Medium and Low index values mean positive, average and negative school climate.

Based on the principals' and teachers' perception, internationally on average, most of the students attended schools of medium level of climate index, at fourth grade this percentage is slightly higher than at eighth grade (66-68, 58-60% respectively).

By far the most students were at the high level of the index in Chinese Taipei where more than half of the students were assigned to this level. They were followed by Anglo-Saxon countries according to school climate (Table 18-25).

Hungarian students were assigned to the medium school climate level with higher percentage than the international average (at fourth grade 73%, at eighth grade 79%), and only 4-8 percent of them attended schools with high school climate level. It can also be noted that the school climate was better at fourth grade according to the answers given by both principals and teachers. In general, principals had more positive perception of school climate index than teachers. It is also true for most participating countries.

Comparing average student achievements on the TIMSS 2007 achievement scale with their school climate indices, it can be concluded that students assigned to higher school climate index level had significantly better results on the average achievement scale than students assigned to low school climate index level. On average internationally, the difference between students attending school of high index level and low index level is between 40 to 60 points on the achievement scale.

In Hungary, at fourth grade, the difference between the results of students attending schools with high level of school climate index and students at lower school climate index is higher than the international average, it is 84-97 points. This difference is somewhat smaller at eighth grade but it is still significant. In mathematics and science, the difference in the average achievement is 75 points in mathematics and 63 points in science between the results of students assigned to the high and the low school climate category based on the perception of the school principals, and 39 points and 46 points science between the results of students assigned to the high and the low school climate category based on teachers' perception.

¹² The school climate index was created by adding and averaging the ratings given by principals and teachers, high index level is 1-2, medium index level is 2-3, and low index level is above 3. Interpreting high index level with low values is a result of assigning low values to positive answers. The eight questions asked were the following: Teachers' job satisfaction, Teachers' understanding of the school's curricular goals, Teachers' degree of success in implementing the school's curriculum, Teachers' expectations for student achievement, Parental support for student achievement, Parental involvement in school activities, Students' regard for school property, Students' desire to do well in school. The answers had to be given on a five-point scale: 1- very high, 2 – high, 3 – medium, 4 – low, 5 – very low.

Background data provided by schools.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (–) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

▼ 2007 percent significantly lower.

Background data provided by schools.

† Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (–) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

▼ 2007 percent significantly lower.

Background data provided by schools.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (–) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

▼ 2007 percent significantly lower.

Background data provided by schools.

¶ Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (–) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

Index based on principals' responses to eight questions about their schools: teachers' job satisfaction; teachers' understanding of the school's curricular goals; teachers' degree of success in implementing the school's curriculum; teachers' expectations for student achievement; parental support for student achievement; parental involvement in school activities; students' regard for school property; and students' desire to do well in school. Average is computed based on a 5-point scale: 1 = very high; 2 = high; 3 = medium; 4 = low; and 5 = very low. High level indicates average is less than or equal to 2. Medium level indicates that average is greater than 2 and less or equal to 3. Low level indicates average is greater than 3.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students.

A diamond (◊) indicates the country did not participate in the assessment.

Index based on principals' responses to eight questions about their schools: teachers' job satisfaction; teachers' understanding of the school's curricular goals; teachers' degree of success in implementing the school's curriculum; teachers' expectations for student achievement; parental support for student achievement; parental involvement in school activities; students' regard for school property; and students' desire to do well in school. Average is computed based on a 5-point scale: 1 = very high; 2 = high; 3 = medium; 4 = low; and 5 = very low. High level indicates average is less than or equal to 2. Medium level indicates that average is greater than 2 and less or equal to 3. Low level indicates average is greater than 3.

† Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◊) indicates the country did not participate in the assessment.

Index based on principals' responses to eight questions about their schools: teachers' job satisfaction; teachers' understanding of the school's curricular goals; teachers' degree of success in implementing the school's curriculum; teachers' expectations for student achievement; parental support for student achievement; parental involvement in school activities; students' regard for school property; and students' desire to do well in school. Average is computed based on a 5-point scale: 1 = very high; 2 = high; 3 = medium; 4 = low; and 5 = very low. High level indicates average is less than or equal to 2. Medium level indicates that average is greater than 2 and less or equal to 3. Low level indicates average is greater than 3.

¶ Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◊) indicates the country did not participate in the assessment.

Index based on teachers' responses to eight questions about their schools: teachers' job satisfaction; teachers' understanding of the school's curricular goals; teachers' degree of success in implementing the school's curriculum; teachers' expectations for student achievement; parental support for student achievement; parental involvement in school activities; students' regard for school property; and students' desire to do well in school. Average is computed based on a 5-point scale: 1 = very high; 2 = high; 3 = medium; 4 = low; and 5 = very low. High level indicates average is less than or equal to 2. Medium level indicates that average is greater than 2 and less or equal to 3. Low level indicates average is greater than 3.

† Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

▼ 2007 percent significantly lower.

	Quebec, Canada		16	(3,2)	536	(5,0)	2	(4,2)	68	(4,3)	518	(3,5)	-5	(5,8)	16	(3,2)	503	(7,3)	3	(4,5)

Index based on teachers' responses to eight questions about their schools: teachers' job satisfaction; teachers' understanding of the school's curricular goals; teachers' degree of success in implementing the school's curriculum; teachers' expectations for student achievement; parental support for student achievement; parental involvement in school activities; students' regard for school property; and students' desire to do well in school. Average is computed based on a 5-point scale: 1 = very high; 2 = high; 3 = medium; 4 = low; and 5 = very low. High level indicates average is less than or equal to 2. Medium level indicates that average is greater than 2 and less or equal to 3. Low level indicates average is greater than 3.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

Index based on teachers' responses to eight questions about their schools: teachers' job satisfaction; teachers' understanding of the school's curricular goals; teachers' degree of success in implementing the school's curriculum; teachers' expectations for student achievement; parental support for student achievement; parental involvement in school activities; students' regard for school property; and students' desire to do well in school. Average is computed based on a 5-point scale: 1 = very high; 2 = high; 3 = medium; 4 = low; and 5 = very low. High level indicates average is less than or equal to 2. Medium level indicates that average is greater than 2 and less or equal to 3. Low level indicates average is greater than 3.

¶ Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

TEACHERS

Students' achievement can be influenced by their family background; however the general socio-demographic indicators of their teachers' backgrounds can also have impact on it as well as other characteristics of the school environment.

Teachers' Gender, Age

On average, internationally there is a great majority of female teachers compared to males. 79 percent of fourth-grade students and nearly 60 percent of eighth-grade students were taught by female mathematics and science teachers.

This distribution of teachers' gender varies from country to country depending on geographical location, cultural characteristics, education policies and the social system. At fourth grade, more than 85 percent of students were taught by females in countries from the former communist block as well as in Italy, Scotland, Austria, Germany, Qatar, Kuwait and the USA. In three European countries and the top-performing Asian countries, the percentages of female teachers and males were more balanced. In these education systems 'only' 50 to 70 percent of students were taught by females.

At eighth grade, the gender distribution of teachers was slightly more balanced. However, in Italy and most of the former communist countries the predominance of female teachers remained. In the Western European countries, the USA, Bosnia and the best achieving Asian countries the percentage of female teachers was almost equivalent to the percentage of male teachers.

In Hungary, at fourth grade 95 percents of students were taught by female mathematics teachers, at eighth grade this percentage was 80 for mathematics and 76 for science. Hungary is among those countries where gender distribution of teachers teaching was the most unequal. Similar percentages could be found in the former communist countries, Italy and at eighth grade in Israel and Malaysia in science.

Concerning the age of teachers it can be noted that at both grades around half of the students were taught by teachers aged 40 or above, and the other half were taught by teachers younger than 40 years of age.

The percentage of students by teachers' age shows similar pattern to the percentage of students by their teachers' gender (Tables 26-29). In most of the former communist countries in Europe a significant percentage of students (60-80%) were taught both science and mathematics by teachers aged 40 or above. Whereas, in the Asian countries, except for Japan, most students were taught by teachers aged below 40. In the Western European countries the percentage does not show the same pattern at fourth grade; there were countries with similar percentages of students taught by teachers aged 40 or above (Italy, Austria, Germany) as in the countries from the former communist block, and there were countries where around half of students were taught by teachers aged below 40 and the other half by teachers aged 40 or above.

At eighth grade, students in the former communist countries were taught mostly by teachers aged 40 or above both in mathematics and in science (60-77%). In the Asian countries the majority of eighth grade students were taught by teachers aged below 40 in science and mathematics. In the Western European countries, as opposed to the fourth grade percentage, half of the students were taught by teachers aged below 40 and the other half was taught by teachers aged 40 or above in most of the countries.

In Hungary, similarly to the other former communist countries, the percentage of students taught by older teachers was high. At fourth grade the ratio of students taught by teachers aged 40 or above was 75 percent, whereas at eighth grade it was 72-76 percent.

STUDENTS' ATTITUDE AND SELF-CONFIDENCE

Students' Attitude Towards Mathematics and Science

TIMSS conducted a survey on students' attitude towards science and mathematics, and investigated the correlation between students' attitudes and students' performances on the TIMSS achievement scale.

To examine how students feel about science and mathematics, TIMSS created an index based on students' responses to three statements about science and mathematics:

1. I enjoy learning mathematics / learning science.
2. Mathematics / Science is boring.
3. like mathematics / science.

Students were assigned to three categories based on their responses (high, medium and low index level). Students who were assigned to the highest index level had the most positive attitude towards the given subject.

Students' attitude towards science or mathematics was usually independent from or even in reverse relationship to their TIMSS 2007 achievement results. Students from the countries with weaker results had usually more positive attitude towards the subjects concerned than the others with better results (with the only exception of Kazakhstan). The negative correlation between attitude and students' achievement can be explained by the fact that students are usually more disagreeing with higher level of performance expectations whilst they are more positive when expectations are smaller (Tables 30, 31, 32, 33).

At fourth grade, students with the greatest majority really like mathematics (78-90%) in the former Soviet States and some Arab countries, whose achievements were lower than the TIMSS scale average, except for two countries. This fact supports the negative correlation between attitude and achievement described above. There were fewer students having really positive attitude towards mathematics in the best-achieving countries (50-67%). This ratio for Hungarian students was 64 percent.

The results are directly influenced by how much students like the subject, however it is important in itself how much schools make students like the subject as further education choices depend not only on students' achievements in a particular subject but also on their attitude towards it.

On average internationally, at fourth grade high attitude index level, i.e. positive attitude towards mathematics is not necessarily accompanied with high or remarkable achievement. Students at the high level of the positive attitude index achieved on average only 26 points higher than students at the medium or low level of the index whose achievements did not differ significantly. At eighth grades, there was a slightly closer relation between positive attitude and results, the difference between the results of students with high index level and medium index level is 30 points, and between the medium and the low index level is 13 points. In science attitude indices, differences in results are lower between each attitude index level.

The impact of positive attitude indices on average achievements of students varies from country to country, but some positive effects can be detected in a number of countries'. Students at high attitude index level usually outperformed students at medium or low attitude index level on the achievement scale while the performance of the latter groups is usually similar to one another.

Relatively small percentages of Hungarian students like mathematics. At fourth grades, the ratio of students at high index level is 69 percent, which is slightly below the international average (72%), whereas the ratio of eighth grade students having a clearly positive attitude towards mathematics is only 30 percent, which is one of the lowest internationally. This value was significantly higher in 1995 and 1999, by 5 and 6 percentage points, respectively.

Results are similar for science as well. At fourth grade, the ratio of students with a positive attitude index is 69 percent, which is slightly below the international average. At eighth grade, even fewer students reported placing high value on the attitude index (53% of students had a positive attitude towards biology, 39% towards earth science index, 31% towards physics, and 29% towards chemistry).

108–112. pages

In Hungary, there is correlation between how much students like mathematics and their results on the TIMSS achievement scale at both grades (more positive attitude was accompanied with better performance on the scale).

In Hungary the attitude index level and the TIMSS achievement scores in science do not necessarily show correlation. On the other hand, it should be noted that when interpreting the impact of attitude at eighth grade the attitude indices for the four separate science subjects and the students' overall science achievements were examined.

Index of Students' Self-confidence and effectiveness

TIMSS examined how students' self-confidence in mathematics and science correlate with their performance on the TIMSS achievement scales. To investigate how students think about their abilities in mathematics and science, TIMSS created an Index of Students' Self-Confidence.

The Index of Students' Self-Confidence was based on students' responses to four statements about their mathematics and science ability and was created by adding and averaging the ratings showing agreement or disagreement with the statements:

1. I usually do well in mathematics / science.
2. Mathematics / Science is harder for me than for many of my classmates.
3. I am just not good at mathematics / science.
4. I learn things quickly in mathematics / science.

Similarly to the mathematics and science attitude indices, the highest percentages of students at high level of self-confidence in mathematics and science were not from countries where students achieved the highest scores on the TIMSS achievement scale in both mathematics and science.

At fourth grade, the highest ratio of the students with high level of self-confidence in mathematics (70-77%) were reported in some developed European countries (Sweden, Austria, Germany, and Denmark) (Table 34). In science, there were also some less developed countries whose students were at the high level of index at a high rate (Table 36).

At eighth grade in mathematics, the highest percentages of students at high level of the index were from North African, Middle East, Anglo-Saxon and Scandinavian countries (53-59%) (Table 35), whereas in science self-confidence levels were highest in Bosnia, Serbia, the Czech Republic, Tunisia, Jordan, Colombia, Algeria, and Georgia (48-72%). (Table 37)

In Hungary, at fourth grade, the ratio of students at high level of the index was 62 percent, at eighth grade it was 42 percent, which is about the same as the international average.

In Hungary, student self-confidence data for science were similar to those for mathematics. At eighth grade, percentages of students at the high level of the self-confidence index were close to the international average percentages, except for chemistry. For chemistry this percentage in Hungary was lower than the average.

Percentages of students at high self-confidence indices in both subjects and both grades decreased significantly compared to percentages in 2003.

On average internationally, there was a positive relation between self-confidence in learning mathematics or science and students' achievements on the TIMSS-scales. Students at the higher level of the self-confidence index had higher average achievement in mathematics and science. Difference between the average achievement of students at high level of the self-confidence index and students at the low level of the index was 42-82 scale scores on average.

This is more or less true for Hungarian students as well. In general, students with high achievement scores on the TIMSS scale in mathematics were those with high level of the self-confidence index. In science there is only one 'dividing line': between the average achievements of students with high level and medium level of self-confidence index. There is no significant difference between the average achievements of students at the medium and low levels of the index.

Index based on students' responses to three statements about mathematics: 1) I enjoy learning mathematics; 2) Mathematics is boring (Reversed); 3) I like mathematics. Average is computed across the three items based on a 4-point scale: 1. Agree a lot; 2. Agree a little; 3. Disagree a little; 4. Disagree a lot. Students agreeing a lot or a little on average across the three statements are assigned to the high level. Students disagreeing a little or a lot on average across the three statements are assigned to the low level. All other students are assigned to the middle level.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available.

An "r" indicates data are available for at least 70 but less than 85% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

▼ 2007 percent significantly lower.

Index based on students' responses to three statements about mathematics: 1) I enjoy learning mathematics; 2) Mathematics is boring (Reversed); 3) I like mathematics. Average is computed across the three items based on a 4-point scale: 1. Agree a lot; 2. Agree a little; 3. Disagree a little; 4. Disagree a lot. Students agreeing a lot or a little on average across the three statements are assigned to the high level. Students disagreeing a little or a lot on average across the three statements are assigned to the low level. All other students are assigned to the middle level.

† Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

Index based on students' responses to three statements about science: 1) I enjoy learning science; 2) Science is boring (Reversed); 3) I like science. Average is computed across the three items based on a 4-point scale: 1. Agree a lot; 2. Agree a little; 3. Disagree a little; 4. Disagree a lot. Students agreeing a lot or a little on average across the three statements are assigned to the high level. Students disagreeing a little or a lot on average across the three statements are assigned to the low level. All other students are assigned to the middle level.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "x" indicates data are available for at least 70 but less than 85% of the students. An "x" indicates data are available for less than 50% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

▼ 2007 percent significantly lower.

Index based on students' responses to four statements about mathematics: 1) I usually do well in mathematics; 2) Mathematics is harder for me than for many of my classmates (Reversed); 3) I'm just not good at mathematics (Reversed); 4) I learn things quickly in mathematics. Average is computed across the four items based on a 4-point scale: 1. Agree a lot; 2. Agree a little; 3. Disagree a little; 4. Disagree a lot. Students agreeing a little or a lot on average across the four statements are assigned to the high level. Students disagreeing a little or a lot on average are assigned to the low level. All other students are assigned to the middle level. () Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

▼ 2007 percent significantly lower.

Index based on students' responses to four statements about mathematics: 1) I usually do well in mathematics; 2) Mathematics is more difficult for me than for many of my classmates (Reversed); 3) Mathematics is not one of my strengths (Reversed); 4) I learn things quickly in mathematics. Average is computed across the four items based on a 4-point scale: 1. Agree a lot; 2. Agree a little; 3. Disagree a little; 4. Disagree a lot. Students agreeing a little or a lot on average across the four statements are assigned to the high level. Students disagreeing a little or a lot on average are assigned to the low level. All other students are assigned to the middle level.

† Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available.

An "r" indicates data are available for at least 70 but less than 85% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

SOURCE: IEA's Trends in International Mathematics and Science Study (TIMSS) 2007.

INSTRUCTIONS AND LEARNING ACTIVITIES

Mathematics and science educational regulations and policies have impact on the overall effectiveness of different education systems. Curricula, the quality and use of textbooks, prescribed amount of time for instruction per year or per week, learning activities in the classroom: all have influence on students' motivation, problem-solving and cooperation skills.

This chapter presents the six characteristics TIMSS examined on mathematics and science instruction: the total amount of instructional time in each subject per year, the use of textbooks, learning activities in lessons, and types of scientific inquiry implemented in class, computer use in science class, mathematics and science homework.

Instructional Time

123–127. pages

TIMSS compared the instructional time that participating countries devoted to mathematics and science per year. Exhibits 13-16 also display teachers' reports about the amount of instructional time actually provided in year 2007 compared to 2003 (in this chapter and in the exhibits instructional time is given in hours which mean 60-minute hours not the 45-minute lessons in Hungary).

In Hungary, there was a decline in the total amount of instructional time devoted to both science and mathematics at both grades, except for fourth grade science. The most considerable change – even in international comparison – was reported at eighth grade science where there was a total of 44 hours decrease in annual instructional time devoted to chemistry, biology, and physics altogether.

At fourth grade, annual instructional time devoted to both mathematics and science was significantly below the international average by 34 hours less in mathematics and 13 hours less in science. On the other hand countries with high achievements on the mathematics and science scales were far above the international average of instructional time devoted to each subject per year. For example, a fourth grade student in Singapore or in England learns mathematics at school in 91 and 73 hours more than their Hungarian peers per year, but a Czech or a Slovenian student is also given one hour more instructional time in mathematics on average per week.

At eighth grade, the comparison of instructional time devoted to mathematics per year in the participating countries shows similar pattern. In Hungary 99 hours of instruction time per year is spent on mathematics, which is the lowest among the better-achieving countries on the TIMSS scale. Among the top-performing countries more instructional time is spent on mathematics in Chinese Taipei, Hong Kong SAR, the USA, Russia, Singapore, and the Czech Republic than in Hungary (additional 59, 49, 49, 32, 25, and 24 instructional hours, respectively).

Considering the instructional time devoted to science in Korea (104 hours), in Japan (103 hours) and in Hong Kong SAR (100 hours) per year and their students' average achievements on the TIMSS-scale it can be concluded that implementing general/integrated science curricula even with low level of instructional time can result in effective science education. On the other hand, two top-performing countries, Singapore and Chinese Taipei where science is taught as an integrated subject, have outstanding number of annual instructional hours devoted to science (140 and 145, respectively). In countries where science is taught as separate subjects more instructional time is spent on science in general.

Textbook use

It is a subject of debate worldwide to what extent teaching should rely on textbooks. Would not be teaching more efficient if teachers' range of activities were not limited to the use of the textbooks? On the other hand, those who support textbook use in classroom argue that using good-quality textbooks in teaching can help students feel more secure because they can rely on them. The TIMSS study did not attempt to decide on this debate, however TIMSS used teacher questionnaires to investigate to what extent students relied on textbooks use in their mathematics and science studies. Teachers could choose from three categories: the textbook remains the primary basis of instruction; the textbook is used as a supplementary resource, or no textbook is used in teaching the given subject.

The results show that the good-performing countries rely to a great extent on textbooks as the primary basis of mathematics and science instruction at fourth grade. In mathematics, the percentage is a little higher (75-98%) than in science, but the latter is also above 70 percent among the good-performing countries. On average internationally, 65 percent of the students in mathematics, and 52 percent of the students in science had teachers who reported using textbooks as the primary basis of instruction. Ratios of students with no use of textbooks in mathematics and science lessons were only a few percent (Tables 38, 39, 40, 41).

The practice in some countries, on the other hand, is different from the average, e.g. in England, Australia, New Zealand and Scotland. These countries appear to be working towards a secondary use of textbooks in mathematics, where textbooks are used only as a supplementary resource in instruction. One-fourth or one-fifth of teachers in England and in Australia reported of using no textbooks at all in their lessons. There was very little textbook use in science, the majority of teachers reported no importance of using textbooks (82% of students in Australia, 80% in New Zealand, 68% in Scotland are taught without using textbooks in science lesson).

At eighth grade, teachers could decrease their reliance on using textbooks as their primary basis and use them as supplementary resources since their students aged between 14 and 15 have more developed skills to solve problems independently. However, this trend is reflected only in the data of the top-performing countries, mainly in science. At eighth grade in Singapore, Chinese Taipei and Japan there were 20 percent fewer students learning without using textbooks compared to fourth grade, whereas the international average of the eighth and fourth grade students were nearly the same.

At eighth grade in Hungary, the importance of textbook use decreased more significantly in mathematics (at fourth grade 77%, at eighth only 55%), whereas the percentages of using no textbooks in lessons did not change across the grades.

128–131. pages

Learning Activities

Examining what kind of skills teachers expect from their students in mathematics and science lessons reveals key information on educational objectives of the participating countries. TIMSS asked such questions in the teacher questionnaires at both grades.

Mathematics

At fourth grade, the TIMSS questionnaire asked teachers about how often students were asked to do certain types of activities in their lessons. For fourth grade three types of activities were listed, for eighth grade – six. Tables 42 and 43 present the results.

It can be noted that there are no national, cultural or even regional characteristics concerning learning activities in the participating countries, or best practices which specify the activities of the top-performing countries. It can only be concluded that at fourth grade teachers reported emphasis on their students' explaining answers and relating what is being learned in mathematics to their daily lives, at eighth grade, in addition to these activities, procedures to solve routine problems is also emphasised.

132–133. pages

Science

The TIMSS questionnaire for both grades asked teachers about how often students were asked to engage in various learning activities in science class, including reading science textbooks or other resources, memorizing science facts and procedures, and, at eighth grade only, solve routine problems. Tables 44 and 45 summarize the teachers' responses. The tables display the data on how often students were engaged in the activities in percentage.

When analysing the results at both grades, it can be concluded that reading in class received almost no emphasis or memorizing science facts has no emphasis at all in participating countries with modern science education. These two learning activities were reported to receive high emphasis in countries with more traditional, information- and theory-centred science education such as Hungary,

134–137. pages

138–143. pages

the former Soviet States, and the majority of Arab countries. Science education in Central European countries like Slovenia, the Czech Republic and Slovakia appeared to follow similar practice to those of the Asian countries.

Tables 46, 47 and 48 provide profiles of the time spent on activities commonly encountered in mathematics and science classes. Teachers were asked to estimate what percentage of teaching time is taken by each of the seven activities.

The general opinion is that in Hungarian education too much time is spent on frontal instruction when students passively listen to lecture-style presentations. Data, however, show a different pattern: Hungarian teachers spend less time than the international average on this activity. On the other hand, among the top-performing Asian countries, most time, usually about half of the class time, was spent on lecture-type instruction.

In Hungary, half of the class time was spent on working on problems either independently or with teacher's guidance. The percentages of the other four activities (checking homework, listening to teacher re-teach and clarify content or procedures, taking tests or quizzes) and participating in classroom management tasks not related to the lessons content/purpose e.g. disciplining students were average, and there were no significant differences compared to other countries' data either.

At eighth grade science, Hungarian data compared to other top-performing countries show a relatively high percentage of time spent on taking tests or quizzes (in Hungary it takes about 14% of class time, the international average is 10%, in England 5%, Hong Kong SAR 8%, Korea 6%, Japan 5%, Singapore 8%, Slovenia 5%, Chinese Taipei 9%). The same high percentage can be observed in the majority of participating countries with more traditional education systems such as Russia, Romania and Bulgaria.

Scientific Inquiry

In teaching science one of the most important elements are the scientific inquiry, observing and engaging inquiry-related activities such as designing and planning as well as conducting an experiment, an investigation.

It is important to note, that such activities should not be listed only in the curricular guidelines but should also be performed in class where students could engage in them accordingly to modern requirements.

The study presents the educational practice of each participating country based on the questionnaires asking teachers on inquiry-related science activities. Teachers reported about how often the seven different activities occurred in their lessons. Tables 49 and 50 display the percentage of students whose teachers reported the particular activity to have occurred in at least half of the lessons.

At both grades, teachers generally reported that the most frequent activities were asking for explanations about something students were studying and relating what they were studying to their daily lives in order to have better understanding of nature. However, some culture- and education-related differences could also be observed in the data.

Countries with more traditional science instructions such as the Central and Eastern European countries, Russia, the Czech Republic, Slovakia and Hungary, place more emphasis on theory-based instructions and acquiring related knowledge, and less on practice. At fourth grades in these countries, the percentage of students who frequently design, plan or do a science experiment or investigation individually or in a small group was low. Even watching the teacher do a science experiment was common only at eighth grades.

Science education in Anglo-Saxon, Scandinavian and Asian countries differ from our more traditional science instruction in a number of aspects. Science is taught as an integrated or general subject in the first eight grades. In lessons more emphasis is placed on designing, planning experiments and working with other students in small groups on science investigations already from the fourth grade: 30-60 percent of students at this early age gain experience and knowledge on this matter. At eighth grade, even more emphasis is placed on practical scientific inquiries.

144–147. pages

Computer Use

Computer use in classroom is one of the most debated issues in today's education policy worldwide. There are a number of educational specialists who consider the use of IT technologies for educational purposes as a revolutionary step in reforming education in the coming decades. Others, however, are more sceptical on this matter suggesting that only a limited use of IT is preferable in classroom. PISA 2006 also investigated this problem and concluded that at present, a greater extent of computer use in mathematics and science education does not necessarily result in better achievements of education systems in mathematics and in science.

TIMSS 2007 also collected data on the role of IT in science education (Tables 51, 52). The tables show the number of countries with a policy on computer use in their national curriculum (second column), the percentages of students whose teachers reported that computers were available in the classroom (third and fourth columns), and the percentages of students being asked to use computers for various activities in about half of the science lessons or more.

At the fourth grade, mainly the Anglo-Saxon countries (England, Australia and Scotland), the Asian countries (Hong Kong SAR, Korea, Japan, Chinese Taipei and Singapore) and some developed Western European countries (Germany, Italy, and Norway) had a policy statement about computer use in their curriculum. It can be concluded, however, that computer use and its presence in the curriculum as policy a statement is not only a policy matter but due to its costs also a financial one. At eighth grade, although there were some additional countries with lower results having policy statements about computer use as part of their curriculum (Botswana, Jordan, Malaysia, Malta, Morocco, and Turkey), the percentages of students having access to computers in science classes were significantly lower than those of the above mentioned countries.

The most common application at the fourth grade was searching for ideas and information on the net. It is the same with eighth grades, but there were some countries e.g. Hong Kong SAR, Korea, Malaysia, Armenia and Turkey where a relatively higher level of computer use was reported for other purposes as well. In Armenia and Korea, the two outstanding countries, one-fifth or more percent of students used the computer in at least half of the science lessons for doing scientific procedures or experiments, studying natural phenomena through simulations, or processing and analyzing data.

In Hungary, a policy statement on computer use can only be found in the curriculum for eighth grade mainly in the context of searching for ideas and information. However, the level of computer use for different purposes in science classes was very low at both grades, only 2 to 4 percent of students used computers in science class. On the other hand, only one fourth of Hungarian students had access to computers in class at least in theory, which is half of the international average, and less than one-third of some developed countries' capacity. At eighth grade, Hungarian students' access to computers in classes is similar to the international average (43%), it is the half or two thirds of the percentages in the countries with similar achievements.

148., 149. pages

Homework

There are significant differences concerning the homework among the participating countries. TIMSS asked teachers how often they assigned homework in science and mathematics, and if homework took more or less than 30 minutes (Tables 53, 54, 55, 56). Students were also asked to report on the frequency of getting homework in science and in mathematics and how long it took to complete (Tables 57, 58, 59, and 60). There are three index categories based on the results. The student in the high index category had homework in about half the lessons or more and it took to complete more than 30 minutes. Students in the low category had homework in less than half the lessons and it took to complete less than 30 minutes. The medium level includes the two other possible combinations of responses.

A group of participating countries place high importance on the role of assigning homework in mathematics and science. These countries include the former Soviet States (Georgia, Kazakhstan, Russia, Armenia and the Ukraine), some Islamic countries (Iran, Tunisia, Algeria, Yemen, Lebanon and Turkey) and Singapore from Asian countries, while at eighth grade Chinese Taipei and Hong Kong SAR. These countries have high percentages of students with high index level.

150–155. pages

156–159. pages

Examining the eighth tables (Tables 53-60) it can be concluded that the high achievement of students in Singapore is supported by a number of extra-school activities, 25-50 percentage of students belong to the high index level. On the other hand, achieving good results on the TIMSS scale does not require hard work on home assignments from students. Although in the Anglo-Saxon countries (England, Australia, the United States, Scotland and New Zealand), in Japan, Korea, the Czech Republic, Slovenia and Sweden teachers assign less homework to their students, their achievements are among the best on the TIMSS scale.

Hungarian students were reported to have less homework than students in most of the participating countries. But there was a substantial variation on mathematics and science homework. In science, most Hungarian students spend little time on doing their homework (60-66%) similar to students in the Anglo-Saxon countries, Japan, Korea, the Czech Republic and Slovenia. However, in mathematics the great majority of students fall into the medium level of the index, and only 4 to 6 percent of students were in the low category. Hungarian students and their teachers reported almost the same in this aspect.

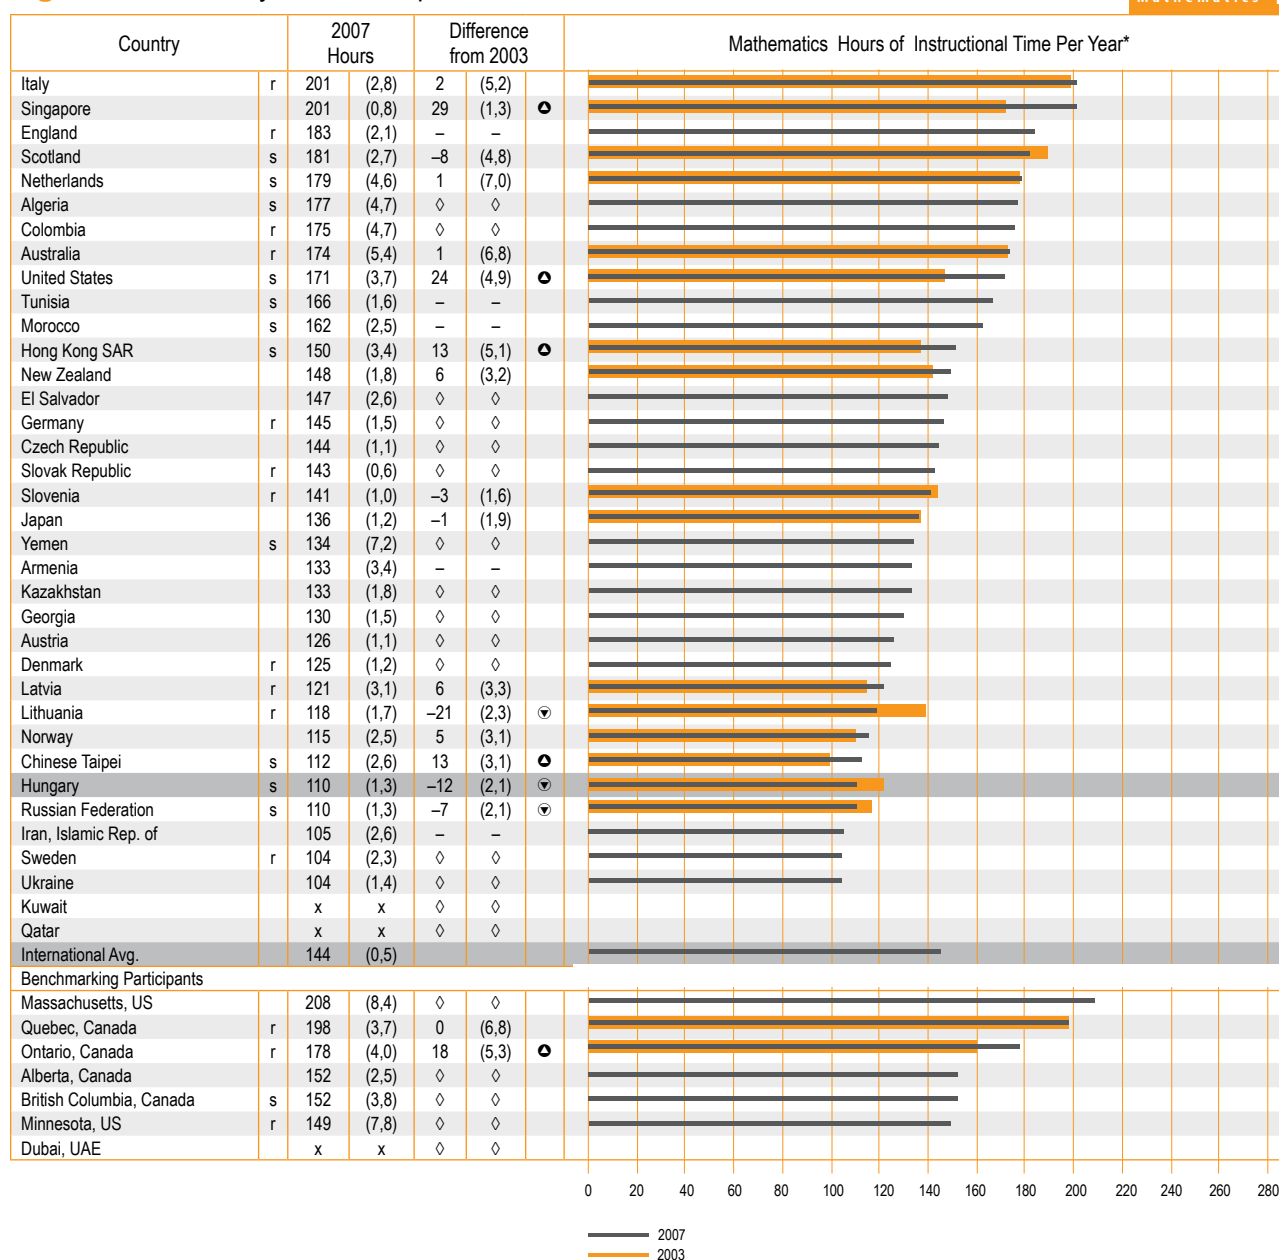

The percentages of students whose teachers always or almost always checked whether or not the homework was completed were extremely high in Hungary (87-92%), on the other hand percentages of students whose teachers corrected assignments and then gave feedback to students were lower than the international average (36% in mathematics and 43% in science). The international average was 59 percent and 63 percent, respectively, but there were countries with over 70 percent including England, Hong Kong SAR, and Singapore. Consequently, teachers in Hungary did not use homework as a basis for class discussion and there was considerably smaller percentage of Hungarian students whose homework contributed to their grades or marks than the international average.

Background data provided by teachers.

a Sweden: Summarizes reports from physics, biology, and chemistry teachers as well as integrated/general science teachers.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (–) indicates comparable data are not available.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

Background data provided by teachers.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

Background data provided by teachers.

a Sweden: Summarizes reports from physics, biology, and chemistry teachers as well as integrated/general science teachers.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (–) indicates comparable data are not available.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

Background data provided by National Research Coordinators and by teachers.

† Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (—) indicates comparable data are not available.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

▼ 2007 percent significantly lower.

● Yes

○ No

Background data provided by National Research Coordinators and by teachers.

ⵜ Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

▼ 2007 percent significantly lower.

● Yes

○ No

Index based on students' reports on the frequency of mathematics homework they are given and the amount of time they spend on that homework. High level indicates mathematics homework assigned at least 3 or 4 times a week and students spend more than 30 minutes on that homework. Low level indicates mathematics homework assigned no more than twice a week and students spend no more than 30 minutes on that homework. Medium level includes all other possible combinations of responses.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

Index based on students' reports on the frequency of mathematics homework they are given and the amount of time they spend on that homework. High level indicates mathematics homework assigned at least 3 or 4 times a week and students spend more than 30 minutes on that homework. Low level indicates mathematics homework assigned no more than twice a week and students spend no more than 30 minutes on that homework.

Medium level includes all other possible combinations of responses.

¶ Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (–) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students.

Index based on students' reports on the frequency of science homework they are given and the amount of time they spend on that homework. High level indicates science homework assigned at least 3 or 4 times a week and students spend more than 30 minutes on that homework. Low level indicates science homework assigned no more than twice a week and students spend no more than 30 minutes on that homework. Medium level includes all other possible combinations of responses.

¶ Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (–) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

Background data provided by National Research Coordinators and by teachers.

Index based on teachers' responses to two questions about how often they usually assign mathematics homework and how many minutes of mathematics homework they usually assign. High level indicates the assignment of more than 30 minutes of homework about half of the lessons or more. Low level indicates no assignment or the assignment of less than 30 minutes of homework about half of the lessons or less. Medium level includes all other possible combinations of responses.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

Background data provided by National Research Coordinators and by teachers.

Index based on teachers' responses to two questions about how often they usually assign mathematics homework and how many minutes of mathematics homework they usually assign. High level indicates the assignment of more than 30 minutes of homework about half of the lessons or more. Low level indicates no assignment or the assignment of less than 30 minutes of homework about half of the lessons or less. Medium level includes all other possible combinations of responses.

† Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

Background data provided by National Research Coordinators and by teachers.

Index based on teachers' responses to two questions about how often they usually assign science homework and how many minutes of science homework they usually assign. High level indicates the assignment of more than 30 minutes of homework about half of the lessons or more. Low level indicates no assignment or the assignment of less than 30 minutes of homework about half of the lessons or less. Medium level includes all other possible combinations of responses.

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students.

A diamond (◇) indicates the country did not participate in the assessment.

● 2007 percent significantly higher.

Background data provided by National Research Coordinators and by teachers.

Index based on teachers' responses to two questions about how often they usually assign science homework and how many minutes of science homework they usually assign. High level indicates the assignment of more than 30 minutes of homework about half of the lessons or more. Low level indicates no assignment or the assignment of less than 30 minutes of homework about half of the lessons or less. Medium level includes all other possible combinations of responses.

† Did not satisfy guidelines for sample participation rates (see Appendix A).

() Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates comparable data are not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70 but less than 85% of the students. An "s" indicates data are available for at least 50 but less than 70% of the students. An "x" indicates data are available for less than 50% of the students.

A diamond (◊) indicates the country did not participate in the assessment.

SOURCE: IEA's Trends in International Mathematics and Science Study (TIMSS) 2007.

SUMMARY

TIMSS has been examining average achievements of the fourth and the eighth grade students in mathematics and in science worldwide since 1995. When developing the survey, TIMSS always consider item format and content to be familiar to the majority of participating countries. In order to achieve such goals, TIMSS created the TIMSS curriculum model, affecting the design of the Assessment Frameworks with a great extent, as well as the TIMSS assessment items were developed through a collaborative process and field tested extensively in participating countries.

The Asian countries have been achieving the most successfully on the TIMSS scale since the beginning of the assessment series. In 2007, Hong Kong SAR, Singapore, Chinese Taipei, Japan and Korea, which participated only at the eighth grade assessment, outperformed the other countries in the mathematics assessment. In mathematics, at fourth grade, Hong Kong SAR, at eighth grade Chinese Taipei achieved 100 scale scores more than the TIMSS-scale average, and 60 points and 80 points more than the next best non-Asian participating countries, respectively.

There were similar results on the TIMSS achievement scale in science as well. However, the difference between the results of the best achieving Singapore at both grades, and the next best non-Asian participating countries' results were significantly lower than in mathematics: 40 scale scores at fourth grade, 25 scale scores at eighth grade.

Students in Hungary also achieved high results on the TIMSS; they had higher than the average achievement results in each assessment cycle. In mathematics and in science at fourth grade Hungarian students were usually at the end of the first one third, whereas in science at eighth grade Hungary was, as usual, among the top-performing countries. Hungary achieved similar results in the TIMSS 2007 assessments as well. Although Hungarian students had slightly lower results than in previous assessment cycles in mathematics, fourth grade students with 510 score points on the mathematics achievement scale and 536 score points on the science scale were close to the results of top-performing countries, whereas the eighth graders were only outranked significantly by the four Asian countries on the top.

Comparison of the trend results show advancement of two Baltic countries, Lithuania and Latvia. At fourth grade, Latvian students achieved 56 points more on the mathematics scale, and 38 points more on the science scale compared to the TIMSS 1995 achievement results. However, Lithuanian students improved mainly at eighth grade (55-point improvement in mathematics, 34-point in science). Considering also the good performance of Estonia in PISA (the country did not participate in the TIMSS assessment), it can be concluded that education in the Baltic States has shown a considerable level of development since they claimed independence from the Soviet Union. Slovenia also showed continuous and considerable improvement through assessment cycles in both assessment domains between 1995 and 2007. At fourth grade students improved outstandingly, in mathematics they performed 40 points higher, in science 54 points higher than their previous results on the TIMSS scale, reaching the TIMSS scale average. At eighth grade, their results showed smaller improvement, achieving 24 points higher on the science scale, 7 points higher on the mathematics scale. Students' results in Singapore and in Hong Kong SAR have shown gains specifically in one subject domain or in a grade, respectively. The former has increased achievement in science, while the latter at the fourth grade results during the 12 years. Sweden, Norway and the Czech Republic were the 'losers' of TIMSS 2007 with 40 to 50-score decline in their average achievements.

Trend data for Hungary indicate that average achievements in mathematics have slightly decreased, by 12 and 10 scale scores at each grade since 1995. In science there has been a 28-point improvement at fourth grade, whereas average achievement has remained the same at eighth grade compared to the results in 1995.

TIMSS 2007 enabled 17 participating countries to examine the cohort of their students' performance that had been assessed in the fourth grade in 2003 and reached the eighth grade by 2007. Comparing the relative performance of the countries, it can be concluded that they fall into two main categories. Curricular changes are suspected in the great majority of the countries when analysing the differences of the cohort since they show similar changes in performance within one assessment cycle between the performances of the fourth grade and the eighth grade. Due to differences between the curricula at the first four grades and at the second four grades in education,

students' relative performance on the scale has improved in both mathematics and science in Norway, Iran and Tunisia, while it declined in the USA and in Italy between 2003 and 2007. There has been significant improvement in performance only in science in countries like Chinese Taipei, Japan and Hungary, in our country it is due to the traditionally extended science curriculum at the upper grades. On the other hand, there are two countries, Slovenia and Armenia, where there may be some other, more structural reasons for the relative performance improvements, since the significant increase in performance shown by the eighth grades were also significantly better related to the performance of the eighth grades in 2003.

Comparing results on the two dimensions of the assessment (content domain and cognitive domain), it can be noted that at both grades the countries scoring highest on the overall assessment tended also to be the highest-scoring countries in each of the content and cognitive domains, and the lowest-scoring countries overall tended to be those with lowest scores in the content and cognitive domains. Countries scoring highest in the Reasoning domain tended also to be the highest-scoring countries in the overall assessment. There is a similar consistency between countries scoring the best in Physics and their results in the overall assessment.

Hungarian students' results were above the international average in all the content and cognitive domains, the majority of them were significantly better than the average. In mathematics, Hungarian eighth graders reached the best results in the Data and Chance content domain (with 24 points above the international average). In scientific domains, at fourth grade they had the best results in Life Science, and at eighth grade they achieved the best in Physics. The fourth graders achieved the second-fourth best average achievement, whereas the eighth graders were among the fifth-seventh best achieving countries with these results (with standard errors taken into account). It is noteworthy that Hungarian students at the fourth grade achieved outstanding results in the Reasoning domain showing that the Knowing domain becomes more dominant later in their studies. At eighth grade, only Hungarian students with achievement above the international average performed the highest scores in the Knowing cognitive domain.

Consistent with the results in the TIMSS2007 scale average, the Asian countries among the top-performers had also the highest percentages of students reaching the advanced international benchmark in mathematics as well as in science. The distribution of Hungarian students reaching each level of the international benchmarks shows good results, especially at eighth grade, where the percentage of students reaching the high international benchmark is among the best in Europe, whereas the percentage of students at the low international benchmark is low. It should be noted, however, that at fourth grade the percentage of students not reaching even the low international benchmark is high compared to the average achievements of students (7 % in science, 12 % in mathematics).

Hungarian students' achievements in mathematics and science are strongly determined by their parents' educational level. It is obvious that it is the most influencing background factor overall, however Hungarian students' performances were, as it can be concluded from PISA and TIMSS survey results, more influenced by this background factor than usual. In countries that participated in TIMSS 2007 and achieved high scores the differences between the results of students with the lowest and the highest educational levels of their parents were 42-104 score points. This difference in Hungary was significantly higher, 129 score points in mathematics and 112 in science. In two other countries in the Central European region these differences are lower, 48 scale scores in the Czech Republic and 67 in Slovenia.

In Hungary, the differences in the educational level of parents are usually accompanied by significant differences in the families' socio-economic status. Consequently, Hungarian students' results are more closely linked to other background factors affecting achievements, such as computer availability at home, Internet access, as they are also indicative of the parents' socio-economic status. Due to the differences in skills of students developing at a relatively young age, the students of schools with higher percentage of students from economically disadvantaged families find themselves in a more disadvantaged situation in Hungary than in many other countries. Consequently, in Hungary, partly due to early school selection, selectivity is rather dominant in secondary schools, which is shown in the results of the national assessments of competences as well as the international PISA survey.

APPENDIX

TIMSS 2007 ASSESSMENT FRAMEWORK

The TIMSS 2007 Assessment Frameworks serves as one of the basic documents for the assessment of Mathematics and Science at fourth and eighth grades.

The TIMSS Assessment Frameworks are a result of collaborative efforts of researchers and test developers in mathematics and science from all over the world. The frameworks were developed based on the curricula of the participating countries and they describe the major content and cognitive domains in mathematics and science to be tested at the fourth and eighth grades.

This appendix contains only an extract of the TIMSS 2007 Assessment Frameworks.

The complete texts of the Assessment Frameworks are available in English at <http://timss.bc.edu/TIMSS2007/frameworks.html>.

MATHEMATICS

Content Domains

The content domains define the specific mathematics subject matter covered by the TIMSS 2007 assessment. Each content domain has several topic areas illustrated with examples; each topic area is presented as a list of objectives covered in the mathematics curriculum in the majority of participating countries.

Fourth – Grade Content Domains

- Number
- Geometric Shapes and Measures
- Data Display

Eighth – Grade Content Domains

- Number
- Algebra
- Geometry
- Data and Chance

Fourth Grade

SZÁMOK

The *number* content domain for the fourth grade includes understanding of place value, ways of representing numbers, and the relationships between numbers. At the fourth grade, students should have developed number sense and computational fluency, understand the meanings of operations (i.e. add, subtract, multiply, and divide) to solve problems. They should be familiar with a range of number patterns, exploring the relationships between the numbers which are in the pattern or are used to derive it.

The Number domain consists of the following major topic areas

- Whole Numbers:
 1. Represent whole numbers using words, diagrams, or symbols.
 2. Demonstrate knowledge of place value, including recognizing and writing numbers in expanded form.
 3. Compare and order whole numbers.
 4. Know the four operations (+, −, ×, ÷) and compute with whole numbers.
 5. Recognize multiples and factors of numbers; read weight and temperature scales marked in multiples.

6. Estimate computations by approximating the numbers involved.
 7. Solve problems, including those set in real life contexts (for example, measurement and money problems).
 8. Solve problems involving proportions.
- Fractions and Decimals:
 1. Recognize fractions as parts of unit wholes, parts of a collection, locations on number lines, and divisions of whole numbers.
 2. Represent fractions using words, numbers, or models.
 3. Identify equivalent fractions; compare and order fractions.
 4. Add and subtract simple fractions.
 5. Show understanding of decimal place value including recognizing and writing decimals using words and numbers.
 6. Add and subtract decimals.
 7. Solve problems involving simple fractions or decimals.
 - Number Sentences with Whole Numbers:
 1. Find the missing number or operation in a number sentence (e.g., if $17 + \underline{\quad} = 29$, what number would go in the blank to make the number sentences true?)
 2. Model simple situations involving unknowns with expressions or number sentences.
 - Patterns and Relationships:
 1. Extend patterns and find missing terms in them.
 2. Describe relationships between adjacent terms in a sequence or between the sequence number of the term and the term.
 3. Generate pairs of whole numbers following a given rule (e.g. multiply the first number by 3 and add 2 to get the second number).
 4. Write or select a rule for a relationship given some pairs of whole numbers satisfying the relationship.

GEOMETRIC SHAPES AND MEASURES

The *geometric shapes and measures* domain includes properties of geometrical figures such as lengths of sides, sizes of angles, areas, and volumes. Students should be able to identify and analyze the properties and characteristics of lines, angles, and a variety of geometric figures, including two- and three-dimensional shapes, and to provide explanations based on geometric relationships. This domain includes understanding informal coordinate systems and using spatial visualization skills to relate between two- and three-dimensional representations of the same shape.

The Geometric Shapes and Measures content domain consists of the following major topic areas

- Lines and Angles:
 1. Measure and estimate lengths.
 2. Identify and draw parallel and perpendicular lines.
 3. Compare angles by size and draw angles (e.g., a right angle, angles larger or smaller than a right angle).
- Two- and Three-dimensional Shapes:
 1. Identify common geometric shapes.
 2. Know, describe, and use elementary properties of geometric figures.
 3. Classify and compare geometric figures, (e.g., by shape, size or properties).
 4. Recognize relationships between three-dimensional shapes and their two-dimensional representations.
 5. Calculate areas and perimeters of squares and rectangles of given dimensions.
 6. Determine and estimate areas and volumes (e.g., by covering with a given shape or by recognizing that area is conserved).

- Location and Movement:
 1. Use informal coordinate systems to locate points in a plane.
 2. Recognize and draw figures with line symmetry.
 3. Recognize and draw reflections and rotations of figures.

DATA DISPLAY

The *data display* content domain includes reading and interpreting displays of data. It also includes understanding how to organize data that have been collected and how to display it in graphs and charts that will be useful in answering the questions that prompted the data collection. Students should be able to compare characteristics of data and to draw conclusions based on data display.

The Data Display content domain consists of the following major topic areas

- Reading and Interpreting:
 1. Read data from tables, pictographs, bar graphs, and pie charts.
 2. Compare information from related data sets (e.g., given data or representations of data on the favourite flavours of ice cream in four or more classes, identify the class with chocolate as the most popular flavour).
 3. Use information from data displays to answer questions that go beyond directly reading the data displayed (e.g., combine data, perform computations based on the data, draw conclusions, and make predictions).
- Organizing and Representing:
 1. Compare and match different representations of the same data.
 2. Organize and display data using tables, pictographs, and bar graphs.

Eighth Grade

NUMBER

The *number* content domain includes understanding of numbers, ways of representing numbers, relationships among numbers, and number systems. At the eighth grade, students should have developed number sense and computational fluency, understand the meanings of operations and how they relate to one another, and be able to use numbers and operations to solve problems. The emphasis within computation is on fractions and decimals rather than on whole numbers.

The Number content domain consists of the following major topic areas

- Whole Numbers:
 1. Demonstrate knowledge of place value and of the four operations.
 2. Find and use multiples or factors of numbers, read scales, and identify prime numbers.
 3. Use the principles of commutativity, associativity, and distributivity.
 4. Evaluate powers of numbers, and square roots of perfect squares to 144.
 5. Solve problems by computing, estimating, or approximating.
- Fractions and Decimals:
 1. Compare and order fractions and decimals.
 2. Demonstrate knowledge of place value for decimals.
 3. Represent decimals and fractions and operations with decimals and fractions using models (e.g., number lines); identify and use such representations.
 4. Recognize and write equivalent fractions.
 5. Convert between fractions and decimals.
 6. Compute with fractions and decimals.
 7. Solve problems by computing, estimating, and approximating.

- Integers:
 1. Represent, compare, order, and compute with integers.
 2. Solve problems using integers.
- Ratio, Proportion, and Percent:
 1. Identify and find equivalent ratios; express ratios.
 2. Divide a quantity in a given ratio.
 3. Convert between percents and fractions or decimals.
 4. Solve problems involving percents and proportions.

ALGEBRA

While functional relationships and their uses for modelling and problem solving are of prime interest, it is also important to assess how well the supporting knowledge and skills have been learned. The *algebra* content domain includes recognizing and extending patterns, using algebraic symbols to represent mathematical situations, and developing fluency in producing equivalent expressions and solving linear equations.

The Algebra content domain consists of the following major topic areas

- Patterns:
 1. Extend numeric, algebraic, and geometric patterns or sequences using numbers, words, symbols, or diagrams; find missing terms.
 2. Generalize pattern relationships in a sequence, or between adjacent terms, or between the sequence number of the term and the term, using numbers, words, or algebraic expressions.
- Algebraic Expressions:
 1. Find sums, products, and powers of expressions containing variables.
 2. Evaluate expressions for given numeric values of the variable(s).
 3. Simplify or compare algebraic expressions to determine equivalence.
 4. Model situations using expressions.
- Equations/Formulas and Functions:
 1. Evaluate equations/formulas given values of the variables.
 2. Indicate whether a value (or values) satisfies a given equation/formula.
 3. Solve simple linear equations and inequalities, and simultaneous (two variables) equations.
 4. Recognize and write linear equations, inequalities, simultaneous equations, or functions that model given situations.
 5. Recognize and generate equivalent representations of functions as ordered pairs, tables, graphs, or words.
 6. Solve problems using equations/formulas and functions.

GEOMETRY

Eighth-grade students should be able to analyze the properties and characteristics of a variety of two and three-dimensional geometric figures, including lengths of sides and sizes of angles, and to provide explanations based on geometric relationships. They should be able to apply the Pythagorean theorem to solve problems. The focus should be on using geometric properties and their relationships. Alongside their appreciation of geometric properties and relationships, students also should be competent in geometric measurement, using measuring instruments accurately, estimating where appropriate, and selecting and using formulas for perimeters, areas, and volumes. The *geometry* content area also includes understanding coordinate representations and using spatial visualization skills to move between two- and three-dimensional shapes and their representations. Students should be able to use symmetry and apply transformation to analyze mathematical situations.

The Geometry content domain consists of the following major topic areas

- Geometric Shapes:
 1. Classify angles as acute, right, straight, obtuse, and reflex (more than 180°); draw such angles.
 2. Know and use the relationships for angles at a point, angles on a line, vertically opposite angles, angles associated with a transversal cutting parallel lines, angle bisection, and perpendicularity.
 3. Recall and use geometric properties of geometric shapes: triangles, quadrilaterals, and other common polygons.
 4. Construct or draw triangles and rectangles of given dimensions.
 5. Identify congruent triangles, quadrilaterals and their corresponding measures.
 6. Identify similar triangles and recall their properties.
 7. Recognize relationships between three-dimensional shapes and their two-dimensional representations, (e.g., nets or two-dimensional views of three-dimensional objects).
 8. Use Pythagorean theorem (not proof) to solve problems.
 9. Apply geometric properties to solve problems.
- Geometric Measurement:
 1. Measure, draw, and estimate the size of given angles.
 2. Measure, draw, and estimate the length of lines, perimeters, areas and volumes.
 3. Select and use appropriate measurement formulas for perimeters, circumferences, areas of circles, surface areas, and volumes.
 4. Find measures of irregular or compound areas (e.g., by covering with grids or dissecting and rearranging pieces).
- Location and Movement:
 1. Use ordered pairs, equations, intercepts, intersections, and gradient to locate points and lines in the Cartesian plane.
 2. Recognize and use line and rotational symmetry for two-dimensional shapes, e.g. to draw symmetrical figures.
 3. Recognize, or demonstrate by sketching, translation, reflection, and rotation.

DATA AND CHANCE

The *data and chance* content domain includes knowing how to organize data that have been collected by oneself or others and how to display data in graphs and charts that will be useful in answering questions that prompted the data collection. This content domain includes understanding issues related to misinterpretation of data.

The Data and Chance content domain consists of the following major topic areas

- Data Organization and Representation:
 1. Read data from tables, pictographs, bar graphs, pie charts, and line graphs.
 2. Organize and display data using tables, pictographs, bar graphs, pie charts, and line graphs.
 3. Compare and match different representations of the same data.
- Data Interpretation:
 1. Identify, calculate and compare characteristics of data sets, including mean, median, range, and shape of distribution (in general terms).
 2. Use and interpret data sets to answer questions and solve problems (e.g., draw conclusions, make predictions, and estimate values between and beyond given data points).
 3. Recognize and describe approaches to organizing and displaying data that could lead to misinterpretation (e.g., inappropriate grouping and misleading or distorted scales).

- Chance:
 1. Judge the chance of an outcome as certain, more likely, equally likely, less likely, or impossible.
 2. Use data from experiments to predict the chances of future outcomes.
 3. Given a context, use the chances of a particular outcome to solve problems; determine the chances of possible outcomes (e.g., a particular face has a one-sixth chance of being on top after dropping a number cube).

Mathematics Cognitive Domains

To respond correctly to TIMSS test items students need to be familiar with the mathematics content being assessed, but they also need to draw on a range of cognitive skills. These three cognitive domains are used for both grades, but the balance of testing time differs.

The three cognitive domains:

- Knowing
- Applying
- Reasoning

Knowing

The *Knowing* cognitive domain includes which mathematical facts, computational procedures and concepts students should know.

This cognitive domain covers the following behaviors

1. Recall • Recall definitions; terminology; number properties; geometric properties; and notation.
2. Recognize • Recognize mathematical objects, shapes, numbers and expressions. Recognize mathematical entities that are mathematically equivalent (e.g., equivalent familiar fractions, decimals and percents; different orientations of simple geometric figures).
3. Compute • Carry out algorithmic procedures for $+$, $-$, \times , \div , or a combination of these with whole numbers, fractions, decimals and integers. Approximate numbers to estimate computations. Carry out routine algebraic procedures.
4. Retrieve • Retrieve information from graphs, tables or other sources; read simple scales.
5. Measure • Use measuring instruments; use units of measurement appropriately; and estimate measures.
6. Classify/Order • Classify/group objects, shapes, numbers and expressions according to common properties; make correct decisions about class membership; and order numbers and objects by attributes.

Applying

In *Applying* cognitive domain the core domains include conceptual understanding and applying knowledge in order to solve problems.

This cognitive domain covers the following behaviors

1. Select • Select an efficient/appropriate operation, method or strategy for solving problems where there is a known algorithm or method of solution.
2. Represent • Display mathematical information and data in diagrams, tables, charts, or graphs, and generate equivalent representations for a given mathematical entity or relationship.
3. Model • Generate an appropriate model, such as an equation or diagram for solving a routine problem.
4. Implement • Follow and execute a set of mathematical instructions. Given specifications, draw figures and shapes.

5. Solve routine problems • Solve routine problems (i.e., problems similar to those target students are likely to have encountered in class). For example, use geometric properties to solve problems. Compare and match different representations of data (eighth grade) and use data from charts, tables, graphs, and maps to solve routine problems.

Reasoning

Reasoning cognitive domains make cognitive demands over and above those needed for solution of routine problems. Problems requiring reasoning may do so in different ways, because of the novelty of the context or the complexity of the situation or because any solution to the problem must involve several steps.

This cognitive domain covers the following behaviors

1. Analyze • Determine and describe or use relationships between variables or objects in mathematical situations; use proportional reasoning (fourth grade); decompose geometric figures to simplify solving a problem; draw the net of a given unfamiliar solid; visualize transformations of three-dimensional figures; compare and match different representations of the same data (fourth grade); and make valid inferences from given information.
2. Generalize • Extend the domain to which the result of mathematical thinking and problem solving is applicable by restating results in more general and more widely applicable terms.
3. Synthesize/ Integrate • Combine (various) mathematical procedures to establish results, and combine results to produce a further result. Make connections between different elements of knowledge and related representations, and make linkages between related mathematical ideas.
4. Justify • Provide a justification for the truth or falsity of a statement by reference to mathematical results or properties.
5. Solve non-routine problems • Solve problems set in mathematical or real life contexts where target students are unlikely to have encountered closely similar items, and apply mathematical procedures in unfamiliar or complex contexts. Use geometric properties to solve non-routine problems.

SCIENCE

Science Content Domains

The content domains for the science assessment specify the domains or subject matter to be assessed within science. To define the science content the participating countries' curricula were used. At the eighth grade, physics and chemistry are assessed as separate content domains, and receive more emphasis than at fourth grade, where they are assessed as one content domain, physical science.

Content Domains at Fourth Grade:

- Life Science
- Physical Science
- Earth Science

Content Domains at Eighth Grade:

- Biology
- Chemistry
- Physics
- Earth Science

Fourth Grade

LIFE SCIENCE

Life science includes understandings of the characteristics and life processes of living things, the relationships between them, and their interaction with the environment.

The Life Science content domain consists of the following major topic areas

- Characteristics and Life Processes of Living Things
 1. Distinguish between living and nonliving things; identify common features of living things (movement; basic needs for air, food, water; reproduction; growth; response to stimuli).
 2. Compare and contrast physical and behavioural characteristics of major groups of organisms (e.g., insects, birds, mammals, plants), and identify or provide examples of plants and animals belonging to these groups.
 3. Relate major body structures in humans and other organisms (plants and animals) to their functions (e.g., digestion takes place in the stomach, teeth break down food, bones support the body, lungs take in oxygen, plant roots absorb water, leaves make food).
- Life Cycles, Reproduction, and Heredity
 1. Trace the general steps in the life cycle of plants germination, growth and development, reproduction, seed dispersal) and animals (birth, growth and development, reproduction, and death); know and compare life cycles of familiar organisms (e.g., humans, butterflies, frogs, plants, mosquitoes).
 2. Recognize that plants and animals reproduce with their own kind to produce offspring with features that closely resemble those of the parents.
- Interactions with the Environment
 1. Associate physical features of plants and animals with the environments in which they live; identify or provide examples of certain physical or behavioural characteristics of plants and animals that make them better suited for survival in particular environments and explain why (e.g., colour change, fur thickness, hibernation, migration).
 2. Describe bodily actions in response to outside conditions (e.g., heat, cold, danger) and activities (e.g., exercise).
- Ecosystems
 1. Understand that plants need the sun to make their own food, while animals consume plants or other animals as food; recognize that all plants and animals need food to provide energy for activity and raw material for growth and repair.
 2. Explain relationships in a given community (e.g., forest, tidepool) based on simple food chains, using common plants and animals and predator-prey relationships.
 3. Present ways in which human behaviour can have a positive or a negative effect on environments; provide general descriptions and examples of the effects of pollution on humans, plants, animals, and their environments, and ways of preventing or reducing pollution.
- Human Health
 1. Recognize ways that common communicable diseases (e.g., colds, influenza) are transmitted; identify signs of health or illness and some methods of preventing and treating illness.
 2. Describe ways of maintaining good health, including the need for a balanced diet, identification of common food sources (e.g., fruits and vegetables, grains), and the effect of personal habits on health (e.g., regular exercise, nutritious diet).

PHYSICAL SCIENCE

Physical science includes concepts related to matter and energy, and covers topics in the areas of both chemistry and physics. Since students in fourth grade have only a beginning knowledge of chemistry, the framework places more emphasis on physics concepts.

The topic areas for Physical Science include

- Classification and Properties of Matter
 1. Compare or classify objects and materials on the basis of physical properties (e.g., weight/ mass, shape, volume, colour, hardness, texture, odour, taste, magnetic attraction).
 2. Identify basic properties of metals and relate them to their use (e.g., conduct heat and electricity, are hard, are shiny, can be moulded).
 3. Identify or describe mixtures on the basis of physical appearance; demonstrate understanding that mixtures can be separated based on the observable properties of their parts (e.g., particle size, shape, colour, magnetic attraction).
 4. Identify properties and common uses of water (e.g., solvent, coolant, heat source) in each of its forms.
 5. Give examples of materials that will dissolve in water and those that will not; and identify common conditions that increase the amount of material that will dissolve or the speed at which materials dissolve (hot water, stirring, small particles).
- Physical States and Changes in Matter
 1. Recognize that matter exists in three major states (solid, liquid, gas), and describe differences in the observable physical properties of solids, liquids, and gases in terms of shape and volume.
 2. Recognize that matter can be changed from one state to another by heating or cooling, and describe these changes in familiar terms (melting, freezing, boiling, evaporation, condensation).
 3. Identify some familiar changes in materials that produce other materials with different characteristics (e.g., decaying of animal or plant matter, burning, rusting, cooking).
- Energy Sources, Heat, and Temperature
 1. Identify common energy sources (e.g., wind, sun, electricity, burning fuel, moving water, food); know some practical uses of energy.
 2. Recognize that heat flows from a hot object to a cold object and causes materials to change temperature and volume; identify common materials that conduct heat better than others; recognize the relationship between temperature measurements and how hot or cold an object is.
- Light and Sound
 1. Identify common sources of light (e.g., bulb, flame, sun); and relate familiar physical phenomena to the presence or absence and the behaviour of light (e.g., appearance of rainbows; colours produced from soap bubbles; formation of shadows; visibility of objects; mirrors).
 2. Recognize that sound is produced by vibrations.
- Electricity and Magnetism
 1. Identify a complete electrical circuit using batteries, bulbs, wires, and other common components that conduct electricity.
 2. Recognize that magnets have north and south poles, that like poles repel and opposite poles attract, and that magnets can be used to attract some other materials or objects.

- Forces and Motion

1. Identify familiar forces that cause objects to move (e.g., gravity acting on falling objects, push/pull forces).
2. Describe how the relative weight of objects can be determined using a balance; relate the weight of different objects to their ability to float or sink.

EARTH SCIENCE

Earth science is concerned with the study of Earth and its place in the solar system. While there is no single picture of what constitutes an Earth science curriculum that applies to all countries, the TIMSS 2007 framework identifies the following topic areas that are universally considered to be important for students at the fourth grade to understand about the planet on which they live and its place in the solar system.

The topic areas for Physical Science include

- Earth's Structure, Physical Characteristics, and Resources

1. Identify substances that make up Earth's surface (e.g., rocks, minerals, sand, and soil), know where these substances are found, and compare some of their physical characteristics and uses.
2. Recognize that most of Earth's surface is covered with water; describe the locations and types of water found on Earth (e.g., salt water in oceans, fresh water in lakes, rivers, clouds, snow, ice caps, icebergs).
3. Provide evidence for the existence and nature of air, including the fact that air contains water (e.g., cloud formation, dew drops, evaporation of ponds), provide or identify examples of the uses of air, and recognize the importance of air for supporting life.
4. Identify or describe common features of Earth's landscape (e.g., mountains, plains, rivers, deserts) and relate them to human use (e.g., farming, irrigation, land development).
5. Identify some of Earth's resources that are used in everyday life (e.g., water, soil, wood, minerals, fuel, food); explain the importance of using these resources wisely.

- Earth's Processes, Cycles, and History

1. Describe the movement of water on Earth's surface (e.g., flowing in rivers or streams from mountains to oceans or lakes); relate the formation of clouds and rain or snow to a change of state of water.
2. Describe changes in weather conditions from day to day or over the seasons in terms of temperature, precipitation (rain or snow), clouds, and wind.
3. Recognize that fossils found in rocks are the remains of animals and plants that lived on Earth a long time ago.

- Earth in the Solar System

1. Describe the solar system as a group of planets (including Earth) each revolving around the sun; recognize that the moon revolves around Earth; draw or describe the phases of the moon; and identify the sun as the source of heat and light for the solar system.
2. Relate daily patterns observed on Earth to Earth's rotation on its axis and its relationship to the sun (e.g., day and night, appearance of shadows).

Eighth grade

Four major content domains – biology, chemistry, physics, and Earth science – define the science content covered in the eighth-grade assessment. It is important to note, however, that in an international assessment such as TIMSS the organization of science topics into these domains does not correspond to the structure of science instruction in all countries. In many countries, for example, science is taught as general science or integrated science whereas in others science is taught as separate subjects such as biology, physics, and chemistry.

Each content domain has several main topic areas to be described next.

BIOLOGY

Biology includes students' understandings of the structure, life processes, diversity, and interdependence of living organisms.

The topic areas for Biology include

- Characteristics, Classification, and Life Processes of Organisms
 1. State the defining characteristics that differentiate among the major taxonomic groups and organisms within these groups, and classify organisms on the basis of a variety of physical and behavioral characteristics.
 2. Locate major organs in the human body, identify the components of organ systems, and compare and contrast organs and organ systems in humans and other organisms.
 3. Relate the structure and function of organs and organ systems to the basic biological processes required to sustain life (sensory, digestive, skeletal and muscular, circulatory, nervous, respiratory, excretory, reproductive).
 4. Explain how biological actions in response to specific external and internal changes work to maintain stable bodily conditions (e.g., sweating in heat, shivering in cold, increased heart rate during exercise).
- Cells and Their Functions
 1. Describe the cellular make-up of all living organisms (both single-celled and multi-cellular), explain that cells carry out life functions and undergo cell division during growth and repair in organisms, and that tissues, organs, and organ systems are formed from groups of cells with specialized structures and functions.
 2. Identify cell structures and some functions of cell organelles (cell wall, cell membrane, nucleus, cytoplasm, chloroplast, mitochondria, vacuoles); compare plant and animal cells.
 3. Describe the process of photosynthesis that takes place in plant cells (the need for light, carbon dioxide, water, and chlorophyll; production of food; and release of oxygen).
 4. Describe the process of respiration that takes place in plant and animal cells (the need for oxygen, breaking down of food to produce energy, and release of carbon dioxide).
- Life Cycles, Reproduction, and Heredity
 1. Compare and contrast how different organisms grow and develop (e.g., humans, plants, birds, insects).
 2. Explain that reproduction (asexual or sexual) occurs in all living organisms and is important for the survival of species; compare and contrast biological processes in asexual and sexual reproduction in general terms (e.g., cell division producing identical offspring versus egg and sperm combination producing offspring that are similar but not identical to either parent); state advantages and disadvantages of each type of reproduction.
 3. Relate the inheritance of traits to the passing on of genetic material contained in the cells of the parent(s) to their offspring; distinguish inherited characteristics from physical or behavioral features that are acquired or learned.
- Diversity, Adaptation, and Natural Selection
 1. Relate the survival or extinction of different species to variation in physical/behavioral characteristics in a population and reproductive success in changing environments.
 2. Recognize the relative length of time major groups of organisms have existed on Earth (e.g., humans, reptiles, fish, plants); describe how similarities and differences among living species and fossils provide evidence of the changes that occur in living things over time.
- Ecosystems
 1. Describe the flow of energy in an ecosystem (the role of photosynthesis and respiration and the storage of food or energy products in organisms); identify different organisms as producers, consumers, and decomposers; draw or interpret food pyramids or food web diagrams.

2. Describe the role of organisms in the cycling of materials (e.g., oxygen, carbon dioxide, water) through Earth's surface and the decomposition of organisms and recycling of elements back into the environment.
 3. Explain the interdependence of populations of organisms in an ecosystem in terms of the effects of competition and predation; identify factors that can limit population size (e.g., disease, predators, food resources, drought); predict effects of changes in an ecosystem (e.g., climate, water supply, food supply, population changes, migration) on the available resources and the balance among populations.
 4. Recognize that the world's human population is growing and identify reasons why (e.g., advances in medicine, sanitation); discuss the effects of population growth on the environment.
 5. Describe the impact of natural hazards (e.g., earthquakes, landslides, wildfires, volcanic eruptions, floods, storms) on humans, wild life, and the environment.
- Human Health
 1. Describe causes of common infectious diseases (e.g., influenza, measles, strep throat, AIDS), methods of infection or transmission, prevention, and the importance of the body's natural resistance (immunity) and healing capabilities.
 2. Explain the importance of diet, hygiene, exercise, and lifestyle in maintaining health and preventing illness (e.g., heart disease, diabetes, skin cancer, lung cancer); identify the dietary sources and role of nutrients in a healthy diet (vitamins, minerals, proteins, carbohydrates, fats).

CHEMISTRY

The *Chemistry* content domain includes mainly concepts of matter and chemical change.

The topic areas for Chemistry include

- Classification and Composition of Matter
 1. Classify or compare substances on the basis of characteristic physical properties that can be demonstrated or measured (e.g., density, thermal or electrical conductivity, solubility, melting or boiling point, magnetic properties).
 2. Recognize that substances may be grouped according to similar chemical and physical properties; describe properties of metals that distinguish them from nonmetals.
 3. Differentiate between pure substances (elements and compounds) and mixtures (homogeneous and heterogeneous) on the basis of their formation and composition, and provide or identify examples of each (solid, liquid, gas).
 4. Describe the structure of matter in terms of particles, including molecules as combinations of atoms (e.g., H_2O , O_2 , CO_2) and atoms as being composed of subatomic particles (electrons surrounding a nucleus containing protons and neutrons).
- Properties of Matter
 1. Select or describe physical methods for separating mixtures into their components (e.g., filtration, distillation, sedimentation, magnetic separation, flotation, dissolution).
 2. Define solutions in terms of substance(s) (solid, liquid, or gas solutes) dissolved in a solvent; apply knowledge of the relationship between concentration or dilution and the amounts of solute or solvent; and of the effect of factors such as temperature, stirring, and particle size on the rate at which materials dissolve.
 3. Relate the behavior and uses of water to its physical properties (e.g., melting point and boiling point, ability to dissolve many substances, thermal properties, expansion upon freezing).
 4. Compare the properties of common acids and bases (acids have a sour taste and react with metals; bases usually have a bitter taste and slippery feel; strong acids and bases are corrosive; both acids and bases dissolve in water and react with indicators to produce different color changes; acids and bases neutralize each other).

- Chemical Change

1. Differentiate chemical from physical changes in terms of the transformation (reaction) of one or more pure substances (reactants) into different pure substances (products); provide evidence that a chemical change has taken place based on common examples (e.g., temperature change, gas production, color change, light emission).
2. Recognize that mass is conserved during chemical change.
3. Recognize the need for oxygen in common oxidation reactions (combustion, rusting); compare the relative tendency of familiar substances to undergo these reactions (e.g., combustion of gasoline versus water, corrosion of steel versus aluminium).
4. Recognize that some chemical reactions give off heat while others absorb it; classify familiar chemical transformations as either releasing or absorbing heat (e.g., burning, neutralization, cooking).

PHYSICS

In *physics*, students' understandings of concepts related to energy and physical processes will be assessed.

The topic areas for Physics include

- Halmazállapotok és az anyag változásai
 1. Szilárd, folyadék és gáznemű anyagok fizikai tulajdonságainak magyarázata a részecskék távolságával és mozgásával kapcsolatos tudás alapján (térfogat, alak, sűrűség, összenyomhatóság).
 2. Az olvadás, a fagyás, a forrás, a párolgás és a lecsapódás folyamata olyan változások, amelyek hőfelvétellel vagy -leadással járnak. E folyamatok sebessége hogyan függ össze egyszerű fizikai tényezőkkel (pl. felszín, oldott anyag, hőmérséklet, tengerszint feletti magasság illetve a nyomás).
 3. A halmazállapot-változások alatt az anyag hőmérséklete nem változik.
 4. Az anyagmegmaradás törvénye érvényes a fizikai változások esetében is.
- Energy Transformations, Heat, and Temperature
 1. Identify different forms of energy (e.g., mechanical, light, sound, electrical, thermal, chemical); describe simple energy transformations (e.g., combustion in an engine to move a car, electrical energy to power a lamp, light energy to chemical energy in photosynthesis, hydroelectric power, changes between potential and kinetic energy); and apply knowledge of the concept of conservation of total energy.
 2. Relate heat to the transfer of energy from an object at a high temperature to one at a lower temperature; compare the relative thermal conductivity of different materials; and compare and contrast methods of heat transfer (conduction, convection, and radiation).
 3. Relate temperature changes to changes in volume and/or pressure and to changes in the movement or speed of particles.
- Light
 1. Describe or identify some basic properties or behaviors of light (transmission from a source through different media; speed of light compared to sound; reflection, refraction {bending}, absorption, and transmission by different materials; splitting of white light into its component colors by prisms and other dispersive media).
 2. Relate the appearance or color of objects to the properties of reflected or absorbed light.
 3. Solve practical problems involving the reflection of light from plane mirrors and the formation of shadows; interpret ray diagrams to identify the path of light and locate reflected or projected images using lenses.
- Sound
 1. Recognize the characteristics of sound (loudness, pitch, amplitude, frequency).
 2. Describe or identify some basic properties of sound (transmission from a source through a medium, reflection and absorption by surfaces, and relative speed through different media).

- Electricity and Magnetism
 1. Describe the flow of current in an electrical circuit; draw or identify diagrams representing complete circuits (series and parallel); classify materials as electrical conductors or insulators; and recognize that there is a relationship between current and voltage in a circuit.
 2. Describe the properties of permanent magnets and the effects of magnetic force; identify essential features and practical uses of electromagnets (e.g., doorbell).
- Forces and Motion
 1. Represent the motion of an object in terms of its position, direction, and speed in a given reference frame; compute speed from time and distance using standard units; and use information in distance versus time graphs.
 2. Describe general types of forces (e.g., weight as a force due to gravity, contact force, buoyant force, friction); predict changes in motion (if any) of an object based on the forces acting on it.
 3. Demonstrate basic knowledge of work and the function of simple machines (e.g., levers) using common examples.
 4. Explain observable physical phenomena in terms of density differences (e.g., floating or sinking objects, rising balloons).
 5. Describe effects related to pressure (e.g., atmospheric pressure as a function of altitude, ocean pressure as a function of depth, evidence of gas pressure in balloons, spreading force over a large or small area, fluid levels).

EARTH SCIENCE

Earth science is concerned with the study of Earth and its place in the solar system and the universe. Topics covered in the teaching and learning of Earth science draw on the fields of geology, astronomy, meteorology, hydrology, and oceanography, and are related to concepts in biology, physics, and chemistry. Although separate courses in Earth science covering all of these topics are not taught in all countries, it is expected that understandings related to Earth science topic areas will have been included in a science curriculum covering the physical and life sciences or in separate courses such as geography and geology. While there is no single picture of what constitutes an Earth science curriculum that applies to all countries, the TIMSS 2007 framework identifies the following topic areas that are universally considered to be important for students at the eighth grade to understand about the planet on which they live and its place in the universe.

The topic areas for Earth Science include

- Earth's Structure and Physical Features
 1. Describe the structure and physical characteristics of Earth's crust, mantle, and core; use and interpret topographic maps; describe the formation, characteristics, and uses of soils, minerals, and basic rock types.
 2. Compare the physical state, movement, composition and relative distribution of water on Earth (e.g., oceans, rivers, ground water, glaciers, ice caps, clouds).
 3. Recognize that Earth's atmosphere is a mixture of gases, and identify the relative abundance of its main components; relate changes in atmospheric conditions (temperature, pressure, composition) to altitude.
- Earth's Processes, Cycles, and History
 1. Describe the general processes involved in the rock cycle (weathering/erosion, deposition, heating/compression, melting/freezing, lava flow) resulting in the continuous formation of igneous, metamorphic, and sedimentary rock.
 2. Diagram or describe the steps in Earth's water cycle (evaporation, condensation, and precipitation), referencing the sun as the source of energy and the role of cloud movement and water flow in the circulation and renewal of fresh water on Earth's surface.

3. Interpret weather data or maps, and relate changing weather patterns to global and local factors in terms of temperature, pressure, precipitation, wind speed and direction, cloud types and formation, and storm fronts.
 4. Compare seasonal climates of major regions on Earth, considering effects of latitude, altitude and geography (e.g., mountains and oceans); identify or describe long- and short-term climatic changes (e.g., ice ages, global warming trends, volcanic eruptions, changes in ocean currents).
 5. Identify or describe physical processes and major geological events that have occurred over millions of years (e.g., weathering, erosion, deposition, volcanic activity, earthquakes, mountain building, plate movement, continental drift); explain the formation of fossils and fossil fuels.
 6. Relate some environmental concerns to their possible causes and effects (e.g., pollution, global warming, acid rain, depletion of the ozone layer, deforestation, desertification); present ways in which science and technology can be used to address these concerns.
- Earth's Resources, Their Use and Conservation
 1. Provide common examples of renewable and nonrenewable resources; discuss advantages and disadvantages of different energy sources; and describe methods of conservation and waste management (e.g., recycling).
 2. Relate effects of human use of land or soil resources (e.g., farming, tree harvesting, mining) to methods used in agriculture and land management (e.g., crop rotation, fertilization, pest control, reforestation).
 3. Discuss factors related to the supply and demand of fresh water and use of water resources (e.g., purification, desalination, irrigation, use of dams, conservation).
 - Earth in the Solar System and the Universe
 1. Explain phenomena on Earth (day and night, tides, year, phases of the moon, eclipses, seasons in the northern and southern hemisphere, appearance of sun, moon, planets, and constellations) in terms of the relative movements, distances, and sizes of Earth, the moon, and other bodies in and outside the solar system.
 2. Recognize the role of gravity in the solar system (e.g., tides, keeping the planets and moons in orbit, pulling us to Earth's surface).
 3. Compare and contrast the physical features of Earth with the moon and other planets (e.g., atmosphere, temperature, water, distance from the sun, period of revolution and rotation, ability to support life).

Cognitive Domains

To respond correctly to TIMSS test items, students need to be familiar with the science content being assessed, but they also need to draw on a range of cognitive skills. This section outlines the skills and abilities associated with the cognitive dimension. The cognitive dimension is divided into three domains: Knowing, Applying, Reasoning.

Knowing

Knowing refers to students' knowledge base of science facts, information, concepts, tools, and procedures. Accurate and broad-based factual knowledge enables students to engage successfully in the more complex cognitive activities essential to the scientific enterprise. Students are expected to recall or recognize accurate science statements; possess knowledge of vocabulary, facts, information, symbols, units, and procedures; and select appropriate apparatus, equipment, measurement devices, and experimental operations to use in conducting investigations. This cognitive domain also includes the selection of illustrative examples in support of statements of facts or concepts.

Elements of Knowing cognitive domain

1. Recall/Recognize • Make or identify accurate statements about science facts, relationships, processes, and concepts; identify the characteristics or properties of specific organisms, materials, and processes.
2. Define • Provide or identify definitions of scientific terms; recognize and use scientific vocabulary, symbols, abbreviations, units, and scales in relevant contexts.
3. Describe • Describe organisms, physical materials, and science processes that demonstrate knowledge of properties, structure, function, and relationships.
4. Illustrate with examples • Support or clarify statements of facts or concepts with appropriate examples; identify or provide specific examples to illustrate knowledge of general concepts.
5. Use tools and procedures • Demonstrate knowledge of the use of science apparatus, equipment, tools, procedures, measurement devices, and scales.

Applying

The questions in this cognitive domain are designed to involve the direct application of knowledge and understanding in straightforward situations. To measure *applying*, TIMSS 2007 will include items that require students to compare, contrast, and classify, to interpret scientific information in light of a science concept or principle, and to use and apply their understanding of science concepts and principles to find a solution or develop an explanation. Items aligned with this cognitive domain will involve the direct application or demonstration of relationships, equations, and formulas in contexts likely to be familiar in the teaching and learning of science concepts. Both quantitative problems requiring a numerical solution and qualitative problems requiring a written descriptive response are included. In providing explanations, students should be able to use diagrams or models to illustrate structures and relationships and demonstrate knowledge of scientific concepts.

Elements of Applying cognitive domain

1. Compare/Contrast/Classify • Identify or describe similarities and differences between groups of organisms, materials, or processes; distinguish, classify, or order individual objects, materials, organisms, and processes based on given characteristics and properties.
2. Use models • Use a diagram or model to demonstrate understanding of a science concept, structure, relationship, process, or biological or physical system or cycle (e.g., food web, electrical circuit, water cycle, solar system, atomic structure).
3. Relate • Relate knowledge of an underlying biological or physical concept to an observed or inferred property, behavior, or use of objects, organisms, or materials.
4. Interpret information • Interpret relevant textual, tabular, or graphical information in light of a science concept or principle.
5. Find Solutions • Identify or use a science relationship, equation, or formula to find a qualitative or quantitative solution involving the direct application/demonstration of a concept.
6. Explain • Provide or identify an explanation for an observation or natural phenomenon, demonstrating understanding of the underlying science concept, principle, law, or theory.

Reasoning

Reasoning is involved in the more complex tasks related to science. A major purpose of science education is to prepare students to engage in scientific reasoning to solve problems, develop explanations, draw conclusions, make decisions, and extend their knowledge to new situations. In addition to the more direct applications of science concepts exemplified in the applying domain, some problem-solving situations involve unfamiliar or more complicated contexts that require students to reason from scientific principles to provide an answer. Some items in this cognitive domain may focus on unified concepts and major conceptual themes, requiring students to bring together knowledge

and understanding from different areas and apply it to new situations. As such, they may involve the integration of mathematics and science and/or the integration and synthesis of concepts across the domains of science.

Elements of Reasoning cognitive domain

1. Analyze/Solve problems • Analyze problems to determine the relevant relationships, concepts, and problem-solving steps; develop and explain problem-solving strategies.
2. Integrate/Synthesize • Provide solutions to problems that require consideration of a number of different factors or related concepts; make associations or connections between concepts in different areas of science; demonstrate understanding of unified concepts and themes across the domains of science; integrate mathematical concepts or procedures in the solutions to science problems.
3. Hypothesize/Predict • Combine knowledge of science concepts with information from experience or observation to formulate questions that can be answered by investigation; formulate hypotheses as testable assumptions using knowledge from observation and/or analysis of scientific information and conceptual understanding; make predictions about the effects of changes in biological or physical conditions in light of evidence and scientific understanding.
4. Design/Plan • Design or plan investigations appropriate for answering scientific questions or testing hypotheses; describe or recognize the characteristics of well-designed investigations in terms of variables to be measured and controlled and cause-and effect relationships; make decisions about measurements or procedures to use in conducting investigations.
5. Draw conclusions • Detect patterns in data, describe or summarize data trends, and interpolate or extrapolate from data or given information; make valid inferences on the basis of evidence and/or understanding of science concepts; draw appropriate conclusions that address questions or hypotheses, and demonstrate understanding of cause and effect.
6. Generalize • Make general conclusions that go beyond the experimental or given conditions, and apply conclusions to new situations; determine general formulas for expressing physical relationships.
7. Evaluate • Weigh advantages and disadvantages to make decisions about alternative processes, materials, and sources; consider scientific and social factors to evaluate the impact of science and technology on biological and physical systems; evaluate alternative explanations and problem-solving strategies and solutions; evaluate results of investigations with respect to sufficiency of data to support conclusions.
8. Justify • Use evidence and scientific understanding to justify explanations and problem solutions; construct arguments to support the reasonableness of solutions to problems, conclusions from investigations, or scientific explanations.

The TIMSS Studies have assessed the trends in mathematics and science achievement of 4th and 8th grade students around the world since 1995. The results from the 2007 study show that Mathematics and Science in public education in Hungary is of high quality, even in an international comparison. Only the countries to have surpassed the Hungarian 8th graders are the Asian countries with their altogether high achievement levels.

The study also shows the effects of factors influencing the public education system as a whole, such as countries with an above average performance in science are overall better in complex task solving strategies. On the other hand, Hungarian students, who are among the highest achievers, perform best in recalling information in 4th grade, applying knowledge in 8th. It is important to note that in Hungary the level of parental education, the economic and social differences between families have a stronger influence than in most European countries.
