The Map of Western Slovakia and North-Western Hungary, 1910

INTRODUCTION[1]

Those interested in the social history of education, the size, the expansion and the internal fragmentation of educated elites, the growth of learning and literacy in various regional and confessional sectors of Central European society during the Dual Monarchy, are offered herewith a properly exceptional, may be unique data bank. The volume contains indeed for the so called "Left side of Danube" region of the historical Hungarian Kingdom the hitherto unexplored (in fact unknown) and detailed results of the census of 1910 as regards the level of schooling of the population, broken down concomitantly by gender, age, denomination and sub-regions (counties and towns with county-level administrative self-government). It represents the second publication of a series which should extend the disclosure of similar types of information over all major regions of the whole country with data distinguished between counties and cities. We have published the datas of Transdanubia

This "Left Side of Danube" region constitutes the Western part of contemporary Slovakia, and a very small piece of contemporary Hungary. Its southern borders are constituted by river Danube, the historical borders of Austria on the West and Carpats from the North. There are only traditional – county frontiers from the East. Its territory comprised 32.929 km² with 2.275.924 inhabitants according to the 1910 census. It was a relatively developed region of the Hungarian Kingdom. This territory was never occupied by the Ottoman empire during the invasions of the 16th and 17th century. This territory was a kind of political centre, Pozsony (Pressburg, the contemporary Bratislava) was the place of Hungarian Parliament till 1848. The region was populated mostly by Slovaks (58,8%) and Magyars (32,7%) . The Southern part of the region had Magyar, the Central and Northern Part had Slovak majority. There was 6,7 % of

[1] This study has been accomplished thanks to the generous support granted to the authors by the Hungarian National Fund for Scientific Research (OTKA programmes nr. T032192 and T34681) in a research of the Hungarian Institute of Educational Research, "Oktatáskutató Intézet". Viktor Karády has also benefited from a yearly Research Support Fund of the Central European University. An other part of database has been published in two volumes: Viktor Karády-Péter Tibor Nagy: Educational inequalities and denominations – Database for Transdanubia. Oktatáskutató Intézet, Budapest, 2003.

population being German by mother tongue in 1910, in town of Poszony this number reached the 41%. Roman Catholics made up the dominant religious cluster in the region, which hosted also significant Lutheran (14,1%) minorities. Besides them Jews represented only 4,0 % of the population with a more notable presence in the entrepreneurial middle classes and in urban environments. In Pozsony their demographic share attained to 10,5 %. The role of Calvinists was only 2,7 % - living in the South Eastern counties of the region. Less then 25 % of the population over 6 years of age was illiterate against a Hungarian Kingdom average exceeding 30 % at that time. Infant mortality was 26,6 % as against a national average of 30,4%.[2]

The source of these data (in hand-written form and in absolute numbers only) have been discovered and made available from the Archive of the Census Department of the Central Statistical Office in Budapest by the perspicacity and perseverance of the junior author, though the elaboration of most results was due to the long established, fraternal cooperation of both signatories of this introduction.

The publication can indeed be considered as exceptional on several scores, by its mere global scope, its systematic character (conveying identical evidence on levels of schooling of all those discerned via the variables resorted to) and, most importantly, by the number of factors simultaneously mobilized for the purpose.

In fact, in the specialized international literature, the mustering of such wide array of essential socio-historical factors (including references to residence, religion, age, gender and even the estimated historical period of schooling) is hardly available to describe the state of 'cultural capital' in a given nation wide population. In Hungary all attempts made to this effect between 1910 and 1941 failed to achieve this, remarkable as they may appear with the benefit of hindsight in the field of comparative social statistics in general. The relevant publication for 1910 would otherwise be exploitable with ultimate results partially identical to ours, but only as far as levels of education for regional and denominational clusters (not specific for age groups) are involved'. Those for 1920, 1930[4] were similarly

---

[2] Miscellaneous data from *Magyar statisztikai évkönyvek.*

[3] See *Magyar statisztikai közlemények*, nr. 61, pp. 526-543. This corresponds to the column 'Total' in our tables. In fact there are some insignificant differences between our respective data. For Budapest for example the published number for Roman Catholics having completed 8 classes of secondary school or more was 22.848 and those with 6 classes was 4810 (see ibid. p. 526) as compared to 22 839 and 4809 in our volume (p. 193). Such differences may be attributable to final revisions made by contemporary officials of the Statistical Bureau on the original sources which served as a basis for our publication. But disparities of this kind are not frequent. There are none for instance as to Lutherans, Greek Catholics, Greek Orthodox, Calvinists, Unitarians or Jews in Budapest, following the same sources.

[4] See *Magyar statisztikai közlemények*, nr. 73, pp. 202-217. Ibid., nr. 96, pp. 314-325.

constructed, but, obviously enough, they could reflect only the situation in the diminished rump state, subsistent after Trianon peace treaty, with the advantage though of introducing the additional category of 'graduates of higher education' as distinct from those who had completed secondary studies (*Matura, érettségi*) only, without going further up the educational ladder. The age specific educational data of the 1941 census have been published without confessional specifications.[5]

It is true that our publication has been preceded by a number of preliminary studies – mostly of an experimental or/and monographic type by the present authors - on denominational inequalities of schooling. They concerned either the whole country[6] or some well circumscribed local populations, especially that of Budapest[7] or some other cities or townships.[8] These works have duly explored several dimensions of schooling inequalities linked to denominational groups, whereby for example important aspects of trends of Jewish over-schooling or various patterns of the confessional hierarchy of educational investments (like the qualitative excellence and quantitative over-representation of Lutherans, along with Jews, in elite education) could be demonstrated. But they left unanswered many other none the less significant questions raised by the strategic conduct of denominational clusters in the school market. Differences and often utterly contrasting uses of public schooling between Orthodox and 'modern' Jewry could thus not

systematically clarified, all the less that these far too broad categories demand to be broken up into units deriving from other classifications (following the influence of Hassidism, the frequency of conversions, the use of Yiddish as against German, etc.), presumably with regional basis, to lend themselves to satisfactory socio-historical interpretation. Similarly, the often observed superiority of Lutherans over other Christians may not hold equally true for the three main ethnic clusters of the group – Germans, Slovakians, Magyars, each with a rather particular residential settlement pattern. Greek Orthodox and Greek Catholics, generally at the bottom of nation wide educational hierarchies, may have shown substantially different performances in urban and in rural environments. All denominational groups may prove to have behaved differently in the given school market when they belonged to weak diasporic minorities, as against regions where they made up the majority of the local population. This must apply particularly to Catholics and Calvinists, the two largest denominational brackets in the country, which were dominating huge geographical spaces in the Dual Monarchy, while they also represented dispersed minorities in other territories.

Such problems can be solved only via recourse to serial educational information on denominational groups covering large regions in a manner that relevant sub-regional comparisons should be made possible on data identically constructed. Our publication is the first designed in this sense for Western Hungary, to be followed by others covering the whole historic territory of the country. We are planning a similar set of publications on ethnic inequalities of education (by mother tongue) extracted from the same source for the same period.

The discovery of age specific educational data for 1910 owes its significance not only to the fact that it is a unique information of that sort available for multi-denominational and multi-ethnic Hungary – and thus offering an ultimate photography of cultural inequalities prevailing before the fall of the Dual Monarchy. It also allows a historical extrapolation, extension or projection backwards in time, on the strength of an analysis qualifiable as 'virtually diachronic'. This method is grounded on an elementary hypothesis that levels of education observed in various age groups at some date can be regarded as representing the intensity of schooling due to kin brackets (by region and denomination) in historical periods when the generational group in question was in schooling age. Thus educational endowments of men over 60 among our data may be interpreted as by and large characteristic of schooling frequencies typical of those born before 1850. Hence the information mustered in this book carries much more weight than just a report on achieved levels of education in various regional and denominational clusters of Hungarian society in 1910.

The real novelty of our enterprise lays thus in its capacity to shed light on the historical development of investments in formal public schooling over a long period approximating, in theory, much more than half a century. In practice, the application of this chronological extrapolation requires a number of qualifications.

One can presume that the sheer reliability of the evidence related to attained levels of formal schooling may suffer serious alterations for certain denominational and generational clusters. Elderly people – for example those beyond 70 in 1910 – belonging to an age group in whose youth the 8 years gymnasium founded by the 1849 *Entwurf* was not fully operational, could experience difficulties to specify their level of schooling corresponding to gymnasium classes in old style Latin colleges. Former *yeshiva* students of the Jewish Orthodoxy, however advanced level they might have reached in Talmudic studies, must have had a hard time to define their educational achievements in terms of modern secondary school classes. Similarly it is unclear how Greek Orthodox seminarists or Pharmacy students of the Medical Faculty of the University of Kolozsvár, admitted to their respective establishments of 'higher education' after 6 years of gymnasium (or sometimes less), classified themselves in the categories used in census questionnaires. A degree of uncertainty and imprecision is inherent in the sources used and, as a consequence, in our data, due to the partial historical inadequacy of the schooling categories applied to the reality of pre-modern educational markets where a portion of the cultural assets, pertaining to the population under scrutiny, had been accumulated.

More specifically, historically retrospective regional data at one point of time are always exposed to imprecision following the intensity of migratory and vital movements of population affecting the groups concerned. This bias appears to be particularly significant for the elderly and those observed in cities. Elderly groups grasped by the census in one place may have been filtered in a denominationally selective manner by the incidence of mortality as well as by immigration and emigration. Younger groups could also be effected, especially by differential rates of arrival to or departure from one town or region, by less by differential death rates (given the fact that the effect of the latter makes itself felt cumulatively in the long run. thus with aging).

However it was, one can argue that death rates were, before the outgoing 19th century, not vastly divergent by denominational clusters, even if several indications point to the relatively early beginning and acceleration of the decline of mortality in Jewry as compared to other confessions. Social selectivity of death rates may have been much more significant though in terms of profession, wealth, class, urbanization. It can be duly supposed thus that those with advanced schooling benefited from a higher rate of survival, hence they remained more often alive in 1910 than others with poor

schooling credentials. If one must recognize the credibility of this hypothesis, one can also suppose that it applied indiscriminately to all denominational clusters in the population - hence no confessional, only generational bias in this respect.

Past trends of migratory movements may represent a more disturbing factor in the interpretation of our data, because they escape any objective (let alone quantified) means of control. There is no serious information about the regional centers of migrations and their directions. The only relatively well identified phenomenon in this context is related to urbanization, particularly the growth of Budapest. But there is no evidence about the selectivity of residential movements into the cities by denomination and social strata, both of these factors being reputed to be connected to educational strategies and levels of schooling. We are thus led to the conclusion that observed high levels of educational achievements in cities may be due not only to the better local accessibility of schools but also, possibly, at least in certain generations and in some places, to the concentration in cities of large sectors of educated elites. Further research is needed to the verification and the qualification of such a hypothesis, since it is also well known that cities attracted a number of lower class and under-educated migrants as well, housemaids for one, but also manual workers, servants and landless peasants among young males. For Budapest though, the overwhelming importance of the administrative, economic and cultural functions performed by the capital city must have substantially contributed to draw there men with high level of schooling from all denominational clusters.

Finally the chronological interpretation of our generational data in different confessional clusters may suffer on account of past religious conversion movements as well. A number of indicators suggest indeed that apostasy in the Dualist Era followed socially selective patterns both in terms of denominations and class – that is, implicitly, by levels of schooling too. Roman Catholics used to be the main profiteers of conversion movements at that time, while Jews were major losers.[9] There are reasons to suppose that, among Christians, conversions were socially less selective and less unilateral though, than among Jews. This meant in practice that while converts may have been more or less equally found in each social classes among Christians, trends of baptism among Jews responded most often to strategies of assimilation proper to professionally mobile, urbanized and educated 'modern' Jewry. This leads to the empirically verifiable hypothesis that indicators of advanced learning, as displayed in our data for Jews, must

[9] Between 1896 and 1905 for example Roman Catholics gained 13.808 and Greek Catholics 3.486 proselytes, as gainst 575 new Unitarians, while all other denominations lost in the balance of religious exchanges by conversions. Cf. *Magyar statisztikai évkönyv*, 1905, p. 417.

fall short of the reality, since some of the best educated in the cluster has been reclassified via conversion in Christian clusters.[10]

If one is well advised to keep all these biases and qualifications in mind in the study of our data, this should not discourage efforts of to appreciate them for their real value : the only available set of 'hard core' socio-historical information concerning the state of effectively 'incorporated' educational resources in Dualist Hungary for Western Slovakian territory (and for the whole country, in further similar publications). With all its shortages and imprecision this is just the best supply of evidence for the study of a crucial problem of the controversial process of nation building in the Carpathian Basin : How – that is, how differently - the modernization process affected in this uniquely multi-ethnic state the various 'particularistic' status groups in their efforts to collect and exploit intellectual capital for social and professional self-assertion and mobility as well as, occasionally (when they were 'aliens' to the titular elites), for cultural assimilation and social integration ?

Our data permit and indeed suggest a number of complex comparisons to this effect not only among age groups inside regional and confessional populations but also, thanks to marginal data on the composition of religious and regional groups by mother tongue (last column following the generational data of each denomination), it helps to reflect the findings in terms of ethnicity as well.

Some explanations may be in order as to specific meanings carried by our data in each table covering, for each denominational cluster, two pages. Information for men and women appears on separate tables for each county and town and take six pages, given the fact that our data distinguish seven confessional groups, those recognized and protected by the state : Roman Catholics, Greek Catholics, Lutherans, Calvinists, Greeks Ortodox, Unitarians and Israelites, in the order as they appeared in official contemporary publications. The 8th category "Other" included all smaller religious clusters whatever their official status could be – Nazarens, Baptists, etc. as well as persons 'without religious affiliation' (*felekezetnelküli, Konfessionlos* in contemporary statistics). The 9th part of the tables constitutes a local sub-total for the county or the town in question. After the name of each confession the relative size of the denominational group in the county or town is indicated in %.

The first column of our tables indicates categories of levels of education of the population observed.

---

[10] See particularly Viktor Karády, *Önazonosítás, Sorsválasztás. A zsidó csoportazonosság alakváltozásai Magyarországon*, Új Mandátum, Budapest, 2001, pp. 263-295, specially pp. 287-288.

8 CLASSES REFER TO ALL

- who have started or/and completed post-secondary studies in a university, a college or an academy;

- who have finished a 8-class secondary school, following a 4 year elementary school. (It could be a classical gymnasium - in the older generations with Latin and Greek, in the younger one mostly with Latin - or a *reáliskola* (*Realschule*). In the reality the realschool is a 8 year long one since the 70s);

- who have finished a *felsõ kereskedelmi* (commercial highschool) offering *Matura*. It had taken earlier less than four years : after 4 elementary school years, 4 classes in a Bürgeschule or secondary school and 3 classes in a commercial highschool . Its Matura gave access to very few post-secondary study tracks;

- who have finished a normal school (teacher training college), considered as by and large equivalent (but legally not equal) to a Matura, without entitlements to further studies;

- who have finished a "girl school", which was a 6 year long one, but it was called "a complete secondary school"-

6 CLASSES, A relatively LESS numerous category indicates those who embarked upon the long secondary study track but dropped out, without completing it.

4 CLASSES indicate persons

-who have finished a lower secondary school (first four, maximum 5 years of a gimnasium or a *reáliskola*;

-who have finished studies in a *polgári* (*Bürgerschule*).

W/R (Write and read) is a category comprising all those considered as the literates, excluding persons who can write only their names.

ILLIT. Is a category for the rest of the population, that is those who can only read, but not write, the illiterates and the unknown cases.

In the category 'TOTAL' are placed first the absolute numbers of the population in each denominational cluster (second column) and, in further columns, the basis of percentages (=100) related to the distribution of each age group in the cluster by levels of education. The last lines of the first column give /1/ the relative size, in %, of age groups in the denominational cluster involved, while /2/ refer to the absolute numbers of each age group.

THE THREE REPRESENTATION INDICES in columns 3-4-5 indicate the average educational achievement (by three levels – 8 classes, 4 classes and illiteracy) of the denominational cluster concerned in comparison to the mean achievement of all (=1) in the region under scrutiny. If the indicator is superior to 1, the cluster is over-represented among those of the same level of schooling. If the indicator is below 1, the cluster appears to be under-represented.

FOR 8 CLASSES the representation index is equal to the division of the % of those having completed 8 classes in the denominational group by the average % of all those with 8 classes in the county or the town. For example in a county where 5 percent of total population and 10 percent of the Lutherans achieved 8 classes, the representation index for Lutherans will be 10/5=2. This is the indication of a very strong over-representation of Lutherans among the most educated clusters. In the same county 3% only of Greek Catholics have finished 8 classes. The representation index will be for them 3/5=0,6 illustrating a case of crass under-representation.

THE INDEX FOR 4 CLASSES is exceptional, since it demonstrates in a cumulative manner all schooling achievements attaining *4 classes and over*. Thus it is calculated in the following way: the cumulated % of those with 8 classes + those with 6 classes + those with 4 classes in a given denominational cluster divided by the similarly accumulated percentages of those with 8, 6 and 4 classes in the whole population of the county or the town under scrutiny.

Hence it offers the most synthetic approach of certified post-primary educational attainments, still a rather rare performance for the majority population at that time, especially among women.

THE INDEX FOR ILLITERACY has been created similarly to the 8 classes index. Naturally this times over-representation concerns the less educated subgroups. The higher the index, the lesser the level of literacy attained.

Since they are related to a local average, these indicators are not strictly comparable from one region to another, but only inside each region. The first of the indices refers to the youngest age group (20-24 years) having potentially achieved its full schooling trajectory and also belonging to the most recent historical generation liable to have done so. This is the best estimate to mirror the local educational situation at the time of the census, if we disregard the possible impact of territorial migrations.

The second representation index concerns a medium age group with still many surviving members (40-44 years) in an age cluster approximately close to just one generation above those of 20-24 years, the former being liable to be the parents of the latter. The comparison between the indices pertaining to the two generation groups can serve as an estimation of the development of educational investments in the denominational clusters involved over twenty odd years.

The last column within the representation block is related to the whole denominational cluster independently of age.

The rest of the columns of the table inform about the distribution of the whole denominational population (column 6) and subsequently of each category of age by levels of schooling attained in the same confessional group.

An exception must be made for the very last column, placed outside the table of educational data proper. It carries a separate set of data on the composition by ETHNIC-NATIONAL clusters (defined by mother tongue or first language used) for each denominational cluster. By this we have tried both to illustrate the ethnically heterogeneous nature of denominational clusters and supply a statistical tool allowing the production of quantified estimations (correlations) of the impact of ethnicity on the educational achievement of denominational clusters. Such estimations appear to be particularly interesting to be attempted for fundamentally multi-ethnic confessions or those ethnic-denominational brackets (like Jews and German Catholics or Lutherans of the region) which could, in 1910, be characterized by variously advanced degrees of cultural assimilation, that is, Magyarization.

The presentation of our data bank, due to its multivariate and extremely detailed nature, has an IN-BUILT PROBLEM. The scarcity of cases for locally poorly represented denominational clusters has produced quantitatively unbalanced tables with many empty cubes for small or locally rare confessional groups, like Unitarians or the Greek religions, massively concentrated in other parts of Hungary, especially in the East. This setback could be avoided only at the price of redesigning each table differently, following the absolute size of each group, neglecting or lumping together all the smaller aggregates. We have chosen the uniform presentation, accepting the minor disadvantage of a large number of cases with 'lack of data', increased by the inevitable ones as to the highest levels of schooling in the youngest age groups.

/1/: Ratio of age group within total of denomination. /2/ Number of age group. Database by Victor Karády and Peter Tibor Nagy. Original source: Archive of the Census Department, Central Statistical Office, Budapest.

Victor *Karády* was born in 1936 and educated in Budapest, Vienna and Paris with advanced degrees in sociology and demography from the Sorbonne. He is a former research director with the French National Center for Scientific Research (*CNRS*, Paris) and professor at the Department of History of the *Central European University* (Budapest). Most of his scholarly career was associated with the *Centre de Sociologie Européenne* under the late Pierre Bourdieu and the *Ecole des Hautes Etudes en Sciences Sociales* in Paris. His recent projects are supported by the Hungarian Institute of Educational Research and the John Wesley Theological College in Budapest. His main fields of interest include historical problems of elite selection and training, the societal functions of schooling, ethnic and denominational inequalities in the process of modernisation of Central European societies, the social history of European Jewry. Last book: *The Jews of Europe in the Modern Era. A Socio-Historical Outline*. Budapest, New York, Central European University Press, 2004. English texts: www.wesley.hu/tanarok.php
